### **Attachment A: Initial Safety Factor Assessment – Bottom Ash Pond**

## **1.0 OBJECTIVE**

This report was prepared by AEP- Geotechnical Engineering Services (GES) section to fulfill requirements of 30 TAC 352.731 (40 CFR 257.73(e)) for the safety factor assessment of CCR surface impoundments. This is the first periodic 5-year review of the safety factor assessment.

## **2.0 DESCRIPTION OF THE CCR UNIT**

The AEP J. Robert Welsh Plant is located in southern Titus County, approximately 8 miles northeast of Pittsburg, Texas, and approximately two miles northwest of Cason, Texas. The facility operates two surface impoundments for storing CCR materials called the Primary Bottom Ash Pond and the Bottom Ash Storage Pond. This report addresses the Bottom Ash Storage Pond. The Bottom Ash Storage Pond CCR unit is located at the south end of the Plant and approximately 1,000 feet west of the Welsh Reservoir.

The Bottom Ash Storage Pond embankments are approximately 20 feet in height and are constructed on a 3:1 slope (3 feet horizontal, 1 foot vertical). The elevation at the base of the embankment is approximately 340 feet above msl, and the elevation at the top of the embankment around the perimeter of the Bottom Ash Storage Pond is approximately 360 feet above msl. As of April 11, 2021, the plant has ceased all sluicing operations and all surface water run-on to the Bottom Ash Storage Pond area. Currently, the plant has initiated closure by removal for the Bottom Ash Storage Pond.

## **3.0 SAFETY FACTOR ASSESSMENT 257.73(e)**

The periodic 5-year review was conducted to evaluate if any physical changes have been made to the earthen dike and/or operating changes that could impact the loading on the structure. The assumptions, material properties and operating pools defined in the initial assessment were reviewed. The review concluded that there have been no changes that would impact the stability analyses that were previously conducted. Therefore, the previous report and analyses are still applicable to the current conditions of the facility. The results indicate that the calculated factors of safety meet or exceed the minimum values defined in Section 257.73(e).

## **1.0 Introduction and Embankment Information**

### **1.1 Introduction**

The following report and evaluation provides the Initial Safety Factor Assessment of the Bottom Ash Pond, an existing CCR impoundment (as defined by 40 CFR §257.2) located at the Welsh Power Plant near Pittsburg, Texas. In accordance with 40 CFR §257.73(e)(1)(i) through (iv) this initial assessment provides field and laboratory data, model outputs (detailing multiple stability conditions) and summary of safety factors for the Bottom Ash Pond. In accordance with 40 CFR §257.73(e)(2) this report provides the Initial Safety Factor Assessment certification for the Bottom Ash Pond.

### **1.2 Referenced Information and Data**

The impoundment pool elevation data cited herein were provided in a separate hydrology and hydraulic (H&H) analysis report completed by Freese and Nichols titled *Hydraulic Analysis of Welsh Power Plant Ash Ponds* dated December 29, 2010 (not included herein). The referenced report generally meets the demonstration requirements of 40 CFR §257.82(a).

Embankment profile dimensions and elevations were determined by using existing information provided by the client. This information is included in the Appendix of this report.

### **1.3 Embankment Evaluation Criteria**

Based on information provided and collected, the existing embankment is primarily lean clay (CL) with existing side slopes (both up- and downstream) of approximately 3:1 (H:V), maximum embankment height of approximately 34 feet (downstream) and top of dam elevation of 360.0 feet MSL. The downstream slope of the embankment is constructed with a 12-foot wide bench (vertical position on the slope varies along the embankment) that supports a 30-inch HDPE decant pipe. To account for the potential loading of the decant pipe, a surcharge load of 150 psf was applied to the bench. The crest width of the embankment is approximately 12 feet. The impoundment's storage area (side slopes and bottom) is lined with a 60-mil HDPE liner. The critical section for the embankment was determined to occur in the vicinity of Boring No. 4, as depicted on the Plan of Borings.

It is our understanding that the maximum storage elevation of impounded CCR material is 355.0 feet (MSL); however, the facility is managed to maintain an ash level less than this maximum level. The downstream toe of the Bottom Ash Pond is not adjacent to other water bodies that may inundate the downstream slope (or toe) and therefore not subject to 40 CFR §257.73(d)(1)(A)(3)(vii).

In accordance with 40 CFR §257.73(e)(1)(i) and (ii), the maximum storage pool elevation for the Bottom Ash Pond as determined by the 25-year, 24-hour storm event is 355.62 feet (MSL). For the purposes of this evaluation, the maximum storage pool elevation of 356.0 feet (MSL) was utilized. Likewise, the maximum (or flood) surcharge loading elevation as determined by the 100-year, 24-hour event is 355.76 feet (MSL), for this evaluation a maximum surcharge loading elevation of 356.0 feet (MSL) was utilized. Storage pool elevations were determined in accordance with 40 CFR §257.82(a).

## **2.0 Field and Laboratory Testing**

### **2.1 Field Activities**

The subsurface exploration of the embankment consisted of advancing a total of seven (7) borings located in potentially critical areas of the embankment. Four (4) borings (Boring Nos. 2 through 5) were completed along the embankment crest with termination depths ranging from approximately 40 to 50 feet. Three (3) borings (Boring Nos. 6 through 8) were completed along the embankment toe and were advanced to termination depths of approximately 40 feet. Boring No. 1 was not accessible by drilling equipment and therefore not completed. Borings were located in the field as shown on the Plan of Borings included in the Appendix of this report.

**Drilling Methods.** Field operations were performed in general accordance with ASTM procedures or similar accepted practices. Soil borings were drilled using a track mounted Geoprobe drilling rig equipped with a rotary head and continuous augers. The use of mud rotary or rotary wash was not necessary.

**Soil Sampling.** Sample intervals were semi-continuous in the upper 10 feet of each boring and five (5) foot intervals thereafter, unless otherwise directed by the onsite engineer. Split- spoon (Standard Penetration Test, SPT) or disturbed samples were collected in general accordance with ASTM Standard Method D 1586. Relatively undisturbed soil samples were collected in general accordance with ASTM D 1587 and extruded in the field and sealed in plastic to protect against moisture loss. Soil shear strengths were determined by using a calibrated hand penetrometer on undisturbed samples.

The collected samples were subsequently examined and selected for laboratory testing by a geotechnical engineer.

**Boring Logs.** The general subsurface soil and groundwater conditions encountered during field activities are presented on boring logs attached in the Appendix of this report. Information on the boring logs includes groundwater levels, laboratory test data, penetration resistance and soil classifications based on the Unified Soil Classification System (USCS).

**Groundwater Level Measurements.** Groundwater level observations completed during field activities are noted on the boring logs attached in the Appendix of this report.

## 2.2 Laboratory Testing Program

Laboratory testing was conducted on selected samples to assist in the classification of the soils encountered and to evaluate the physical and engineering properties of subsurface soils. Laboratory test results are presented on the boring logs included in the Appendix. Laboratory tests were performed in general accordance with ASTM procedures cited in the table below.

Laboratory Test	Test Designation
Atterberg Liquid Limit and Plastic Limit Determination	ASTM D 4318
Percentage Soil Passing No. 200 Sieve	ASTM D 1140
Moisture Content Determination	ASTM D 2216
Particle Size Analysis of Soils	ASTM D 422
Unconsolidated Undrained (UU) Triaxial Compression	ASTM D 2850
Hydraulic Conductivity	ASTM D 5084
Consolidated Undrained (CU) Triaxial Compression	ASTM D 4767
Direct Shear of Soils Under Consolidated Drain Conditions	ASTM D 3080

Soil samples not utilized in laboratory testing will be retained for approximately 30 days from the report issuance date and then disposed, unless specifically requested in writing from the client.

## 3.0 Slope Stability Analyses

### 3.1 General

Soil parameters used for stability analyses of the existing embankment are based on findings of the completed laboratory and field testing programs and previous assessments completed as the Welsh Power Plant. The probable failure planes were analyzed using the analytical slope stability software, SLIDE by Rocscience, Inc. Methods of evaluation used in SLIDE are considered to be limited equilibrium methods of analysis, where each individual shear plane is evaluated to determine the resulting shear stress at the point of failure. For the purposes of this evaluation the Bishop Method of analysis, which analyzes circular failure planes through the slope was utilized.

Per 40 CFR §257.73(e)(1)(i) through (iii), three (3) modeled scenarios (presented below) were utilized to evaluate the stability of the existing embankment: steady state seepage (long term) condition under maximum storage pool, steady state seepage (long term) condition under maximum surcharge pool, and steady state seepage condition with seismic loading under maximum storage pool conditions. The following minimum factors of safety (FS) and soil stress parameters were utilized in modeling. Minimum factors of safety are based on demonstration requirements provided in 40 CFR §257.73(e)(1).

<b>Summary of Embankment Condition and Factor of Safety</b>		
<b>Embankment Condition</b>	<b>Soil Parameters</b>	<b>Minimum Factor of Safety</b>
Steady State Seepage – Maximum Pool	Effective Stress	1.50
Steady State Seepage – Surcharge Pool	Effective Stress	1.40
Steady State Seepage (Seismic) – Maximum Pool	Total Stress	1.00
<b>NOTE:</b> Minimum factors of safety based on demonstration requirements provided in 40 CFR §257.82 (e)(1).		

For evaluation of steady state seepage (long term) conditions with seismic, peak ground acceleration for this location was obtained from the USGS National Seismic Hazard Mapping Project (<http://earthquake.usgs.gov/hazards>). Based on the seismic survey data, the anticipated site specific peak ground acceleration (PGA) of 0.06g (acceleration at rock sites) for two (2) percent probability of exceedance in 50 years (40 CFR Part 257, Preamble page 21384). Correcting for acceleration at soft soil sites (Seismic Site Classification D) yields an estimated PGA of 0.13g. The seismic coefficient (k) used for pseudo static analysis is determined by reducing the estimated PGA by 50% yielding a seismic coefficient of 0.065g.

### 3.2 Liquefaction Assessment

Liquefaction of soils occurs when horizontal shearing stresses exceed the strength of existing loose, saturated sand. This sudden loss of shear strength and subsequent soil structure is typically associated with earthquake-induced horizontal movement. Recent engineering publications<sup>1</sup> provide criteria to assess liquefaction potential of sands (little to no fines) and clayey soils of low plasticity (e.g. clayey sands, silts). These criteria indicate that water content of fine-grained or cohesive soils needs to be high ( $\geq 0.85 \cdot \text{Liquid Limit [LL]}$ ), a clay fine content (defined as grains smaller than 0.002 mm) of less than 10 percent ( $< 10\%$ ), and relatively low soil density (assessed in terms of SPT blow counts). In addition, the accepted minimum seismic threshold acceleration to cause liquefaction in loose sands is 0.10g, the anticipated site specific PGA for this site is 0.06g.

Native coarse grained (or sandy) material underlying the Bottom Ash Pond generally consist of medium dense to very dense silty sand (SM), clayey sand (SC) and silt (ML) and fine grained (or clayey) material consist of medium stiff to hard lean clay and fat clay (CL and CH) soils. Based on these soil characteristics and that the Bottom Ash Pond is located in

<sup>1</sup> Seed, R.B., et al, Recent Advances in Soil Liquefaction Engineering: A Unified and Consistent Framework, 26<sup>th</sup> Annual ASCE Los Angeles Spring Seminar, April 2003

a zone of low peak ground acceleration (PGA), the risk of either embankment or underlying soils liquefying are negligible [40 CFR §257.73(e)(1)(iv)].

### 3.3 Embankment and Foundation Stratigraphy

The models developed for this evaluation are based on the existing embankment geometry, results of field and laboratory testing and hydrologic site information provided by the client. Selection of the critical slope section was based on both height and subsurface sensitivity to loading. The following tables provide a summary of soil parameters used for these analyses. Specific soil parameters used for each model are presented in the Appendix.

<b>Summary of Long Term, Total Stress Soil Parameters:</b>			
<b>Material Type</b>	<b>Unit Weight (pcf)</b>	<b>Consolidated-Undrained Cohesion (psf)</b>	<b>Consolidated-Undrained Angle of Internal Friction (degrees)</b>
Embankment Fill	125	250	28
Silty, Clayey Sand (SM_SC)	120	225	20
Silty Sand (SM)	120	0	30
Native Fat and Lean Clay (CH_CL)	125	450	14
Ash	100	0	30
<b>NOTE:</b> Properties used for Steady State Seepage with Seismic analyses.			

<b>Summary of Long Term, Effective Stress Soil Parameters</b>			
<b>Material Type</b>	<b>Unit Weight (pcf)</b>	<b>Consolidated-Drained Cohesion (psf)</b>	<b>Consolidated-Drained Angle of Internal Friction (degrees)</b>
Embankment Fill	125	150	32
Silty, Clayey Sand (SM_SC)	120	0	34
Silty Sand (SM)	120	0	36
Native Fat and Lean Clay (CH_CL)	125	300	22
Ash	100	0	30
<b>NOTE:</b> Properties used for Steady State Seepage analyses. Consolidated-drained conditions determined based on pore pressure measurements made during Consolidated-Undrained (CU) triaxial testing.			

The HDPE liner was modeled at the interface of the slope and the ash pond, a nominal strength of 50 psf was assumed for the liner material.

### 3.4 Seepage Analysis Parameters

The observed groundwater levels while drilling through the embankment (approximate groundwater elevation of 30 to 34 feet, below the crest) correspond with those groundwater elevations encountered while drilling adjacent to the embankment toe (approximately groundwater elevation six [6] feet, below existing grade). No elevated groundwater seepage or groundwater levels were observed in boreholes completed in the embankment that would indicate a prolific and defined phreatic surface in the embankment.

Therefore, based on the available information it appears that the existing impermeable liner has precluded the development of a phreatic surface (internal groundwater elevation) within the embankment. Though the probability of a phreatic surface developing in the embankment is considered low, it is however possible, and therefore was modeled as part of the structural assessment.

The analysis of embankment seepage is based on laboratory results and estimated values for permeability for various embankment and native foundation soils. These soil parameters were utilized in the models to establish a long term steady state condition and corresponding phreatic surface in the embankment. Hydraulic conductivity test results are provided in the Appendix. Hydraulic conductivity properties utilized in the seepage analysis are provided in the below table.

<b>Hydraulic Conductivity of Embankment Soils</b>	
<b>Material Type</b>	<b>Permeability (ft/sec)</b>
Embankment Fill	$1 \times 10^{-8}$
Silty, Clayey Sand (SM_SC)	$1 \times 10^{-5}$
Silty Sand (SM)	$1 \times 10^{-5}$
Native Fat and Lean Clay (CH_CL)	$1 \times 10^{-8}$
Ash	$1 \times 10^{-4}$

The HDPE liner is assumed to be impermeable; therefore a very low permeability value of  $1 \times 10^{-20}$  ft/sec was utilized.

### 3.5 Stability Analysis Results

The following table provides the results of the stability analysis for each of the conditions cited herein, as required by 40 CFR §257.73(e)(1)(i) through (iii). The graphical representations of each analysis are included in the Appendix.

<b>Summary of Stability Analyses – Safety Factors</b>		
<b>Modeled Condition</b>	<b>Factor of Safety</b>	
	<b>Actual</b>	<b>Minimum</b>
Steady State Seepage – Maximum Pool	2.60	1.50
Steady State Seepage – Surcharge Pool	2.60	1.40
Steady State Seepage with Seismic – Maximum Pool	1.60	1.00

<b>Summary of Stability Analyses– Safety Factors (Potential Phreatic Surface)</b>		
<b>Modeled Condition</b>	<b>Factor of Safety</b>	
	<b>Actual</b>	<b>Minimum</b>
Steady State Seepage – Maximum Pool	1.78	1.50
Steady State Seepage – Surcharge Pool	1.78	1.40
Steady State Seepage with Seismic – Maximum Pool	1.31	1.00

Based on the findings of this analysis, the evaluated embankment appears to be stable under both modeled conditions (existing conditions and potential phreatic surface) and demonstrate the minimum safety factors, as required by 40 CFR §257.73(e)(1)(i) through (iii).

### 4.0 Report Limitations

This report has been prepared for the exclusive use of our client for the specific application to the project discussed and has been prepared in accordance with the generally accepted geotechnical engineering practices. No warranties, either express or implied, are intended or made. The analyses contained in the report are based on the data obtained from the soil

borings performed within the project site. This report does not reflect variations that may occur between borings or across the site. Soil borings do not necessarily reflect strata variations that may exist at other locations within the project site.

### 5.0 Initial Structural Stability Assessment Certification

By means of this certification, (i) I have reviewed the requirements of 40 CFR §257.73(e)(1) – *Periodic Safety Factor Assessments*, (ii) I or my agent has visited and examined the facility, (iii) the referenced data used in this evaluation to the best of my knowledge appears correct and appropriate for use, (iv) and this Initial Safety Factor Assessment for the Bottom Ash Pond (Welsh Power Plant) has been prepared to the best of my knowledge in accordance with §257.73(e)(1).

## Boring Log Terms and Symbols

### Symbols and Sampler Types

- Thin-walled Tube (Shelby Tube)
- X Standard Penetration Test (SPT)
- Auger Sample
- X Texas Cone Penetration Test (TCP)
- ▼ Observed Static-Water Level
- ▽ Observed Free Water (Seepage)

### Soil Consistency and Structure

Strength of Fine Grained Soils		
Consistency	SPT (Blows/ft)	UCS (tsf)
Very Soft	< 2	< 0.25
Soft	2 - 4	0.25 - 0.5
Medium Stiff	4 - 8	0.5 - 1.0
Stiff	8 - 15	1.0 - 2.0
Very Stiff	15 - 30	2.0 - 4.0
Hard	> 30	> 4.0

Density of Coarse Grained Soils		
Consistency	SPT (Blows/ft)	TCP (Blows/ft)
Very Loose	0 - 4	< 8
Loose	5 - 10	9 - 20
Medium Dense	11 - 30	21 - 60
Dense	31 - 50	61 - 100
Very Dense	> 50	> 100

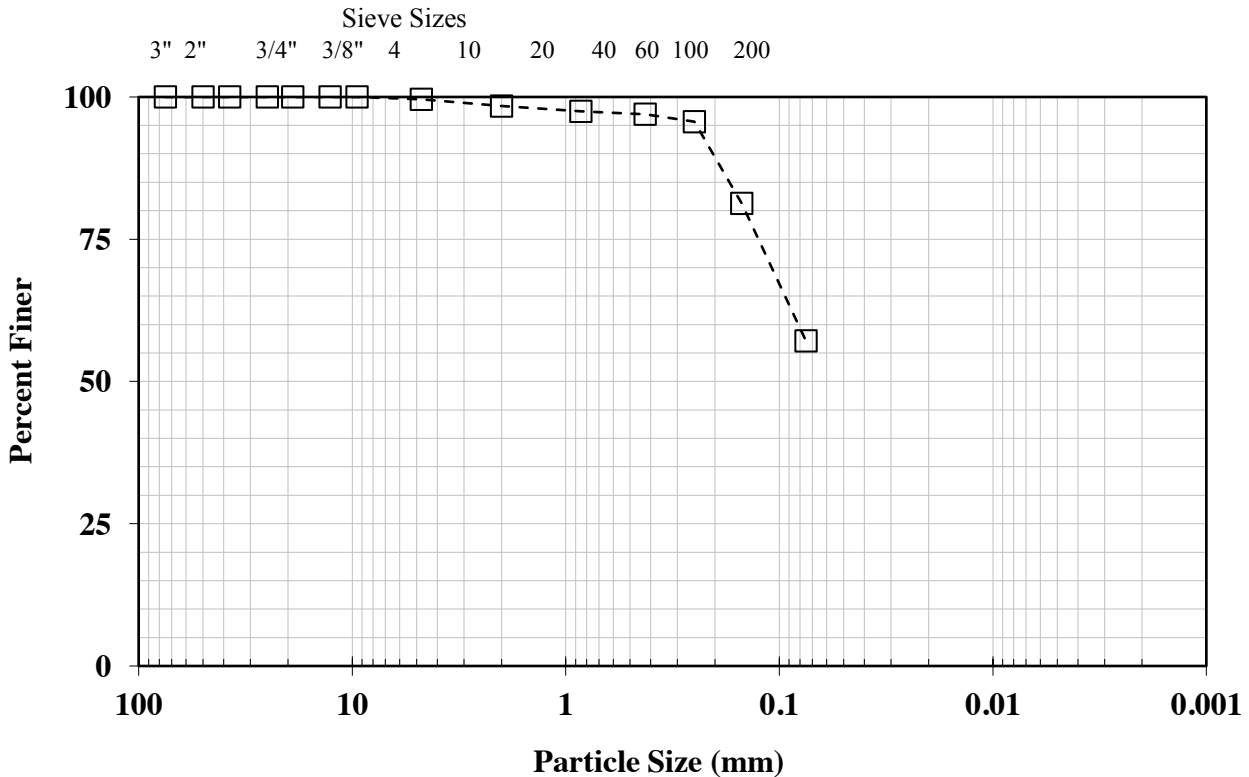

Soil Structure - Description	
Description	Explanation
Laminated	Alternating layers of varying material or color.
Slickensided	Fractured polished planes, little resistance to fracturing
Blocky	Cohesive soil that can be broken into small angular pieces.
Lensed	Inclusion of small pockets of different soils
Homogeneous	Same appearance and color throughout

## Particle Size Analysis for Soils

### Unconsolidated-Undrained (Q) Triaxial Compression

Client: Auckland Consulting LLC  
 Project: Winston Pond  
 Sample: B2: 11-13

TRI Log #: 20888  
 Test Method: ASTM D2850

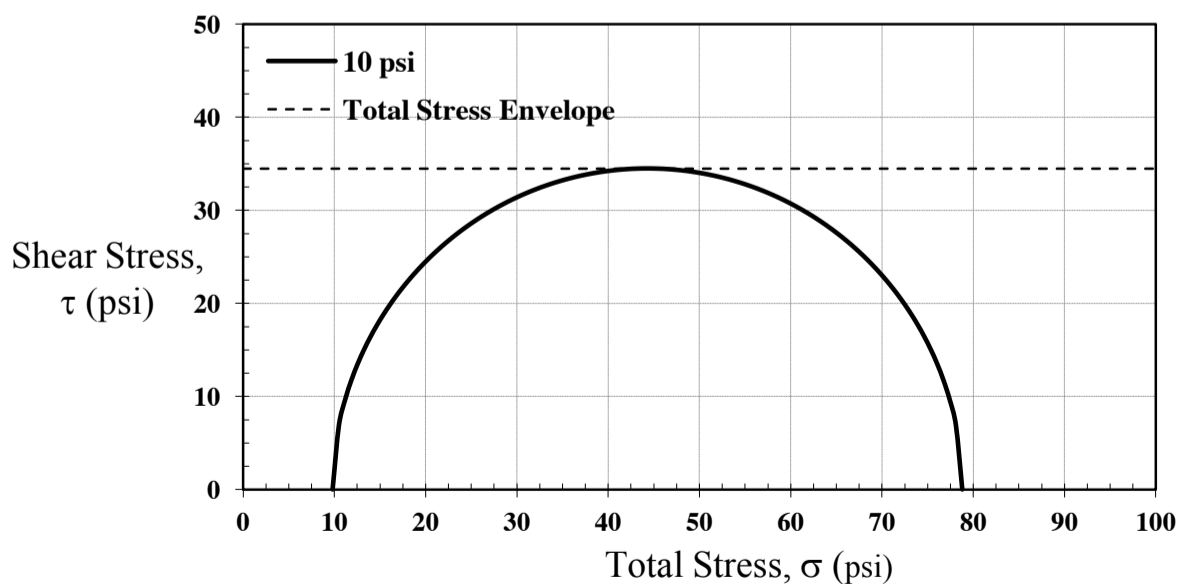

Test Parameters	
Minor Principal Stress (psi)	10.0
Rate of Strain (%/hr)	60

Initial Properties	
Avg. Diameter (in)	2.84
Avg. Height (in)	5.61
Avg. Water Content (%)	15.5
Bulk Density (pcf)	132.1
Dry Density (pcf)	114.4
Saturation (%)	92.0
Void Ratio	0.45
Specific Gravity (Assumed)	2.65

At Failure - Maximum Deviator Stress	
Axial Strain at Failure (%)	10.6
Minor Total Stress (psi)	10.0
Major Total Stress (psi)	79.0
Principal Stress Diff. (psi)	69.0

Total Stress Envelope	
Friction Angle (deg)	0
Undrained Shear Strength, $S_u$ (psi)	34.5
$S_u / \sigma_3$	3.4

Note: The Mohr failure envelope was taken as a horizontal straight line. It should, however, be noted that the specimen was partially saturated.

### Multi-Stage Consolidated-Undrained Triaxial Compression

Client: Auckland Consulting LLC  
 Project: Winston Pond  
 Sample: B-5 (5-7)

TRI Log #: 21381  
 Test Method: ASTM D4767 Mod

#### Mohr-Coulomb

Failure Criterion: Peak Principal Stress	Difference, $(\sigma'_1 - \sigma'_3)_{max}$	Ratio, $(\sigma'_1 / \sigma'_3)_{max}$
Effective Friction Angle (deg)	-	32.3
Effective Cohesion (psi)	-	0 (Forced)

### Multi-Stage Consolidated-Undrained Triaxial Compression

Client: Auckland Consulting LLC  
Project: Winston Pond  
Sample: B-5 (5-7)

TRI Log #: 21381  
Test Method: ASTM D4767 Mod

### Multi-Stage Consolidated-Undrained Triaxial Compression

Client: Auckland Consulting LLC  
Project: Winston Pond  
Sample: B-5 (5-7)

TRI Log #: 21381  
Test Method: ASTM D4767 Mod

#### Consolidation

## Direct Shear of Soil Under Consolidated-Drained Conditions

Client: Auckland Consulting LLC  
 Project: Winston Pond  
 Sample: B-5 (13-15)

TRI Log#: 21381  
 Test Method: ASTM D 3080

Sample Number		1	2	3
Initial Condition	Diameter, in	2.50	2.50	2.50
	Height, in (before consol)	1.00	1.00	1.00
	Water Content, %	16.9	16.0	15.6
	Saturation, %	83.9	83.6	89.1
	Dry Density, pcf	107.9	109.7	112.9
	Void Ratio	0.53	0.51	0.46
Post Consol	Height, in (prior to shear)	1.00	1.00	1.00
	Final Water Content, %	21.1	20.9	19.2
	Dry Density, pcf	108.0	109.9	113.3
	Void Ratio	0.53	0.50	0.46
Displacement rate (in/min)		6.0E-04	6.0E-04	6.0E-04
Peak	Normal Stress, $\sigma'$ (psi)	5.23	10.43	15.72
	Shear Stress, $\tau$ (psi)	3.94	8.01	13.01
	Displacement (in)	0.09	0.08	0.09
	$\phi'_d$ , degrees	38.8		
	$c'_d$ , psi	0 (Forced)		
Post-Peak	Normal Stress, $\sigma'$ (psi)	5.56	11.12	16.70
	Shear Stress, $\tau$ (psi)	3.07	7.31	12.26
	Displacement (in)	0.20	0.20	0.20
	$\phi'_d$ , degrees	35.0		
	$c'_d$ , psi	0 (Forced)		

Note: The undisturbed soil samples were extruded and trimmed using a trimming turntable. A specific gravity of 2.65 was assumed for weight-volume calculations.

## Hydraulic Conductivity

Client: Auckland Consulting LLC  
 Project: Winston Pond  
 Sample ID: B-5: (33-35)

TRI Log #: 21381  
 Test Method: ASTM D5084  
 Method C

Initial Values	
Sample Condition	Undisturbed
Diameter (in)	2.80
Height (in)	2.55
Initial Mass (g)	500.5
Sample Area (in <sup>2</sup> )	6.16
Water Content (%)	26.4
Total Unit Weight (pcf)	121.4
Dry Unit Weight (pcf)	96.1
Specific Gravity (Assumed)	2.65
Degree of Saturation	96.9
Void Ratio	0.72
Porosity	0.42
1 Pore Volume (cc)	107.8
Eff. Confining Stress (psi)	5.0
B-Value Prior to Permeation	0.99

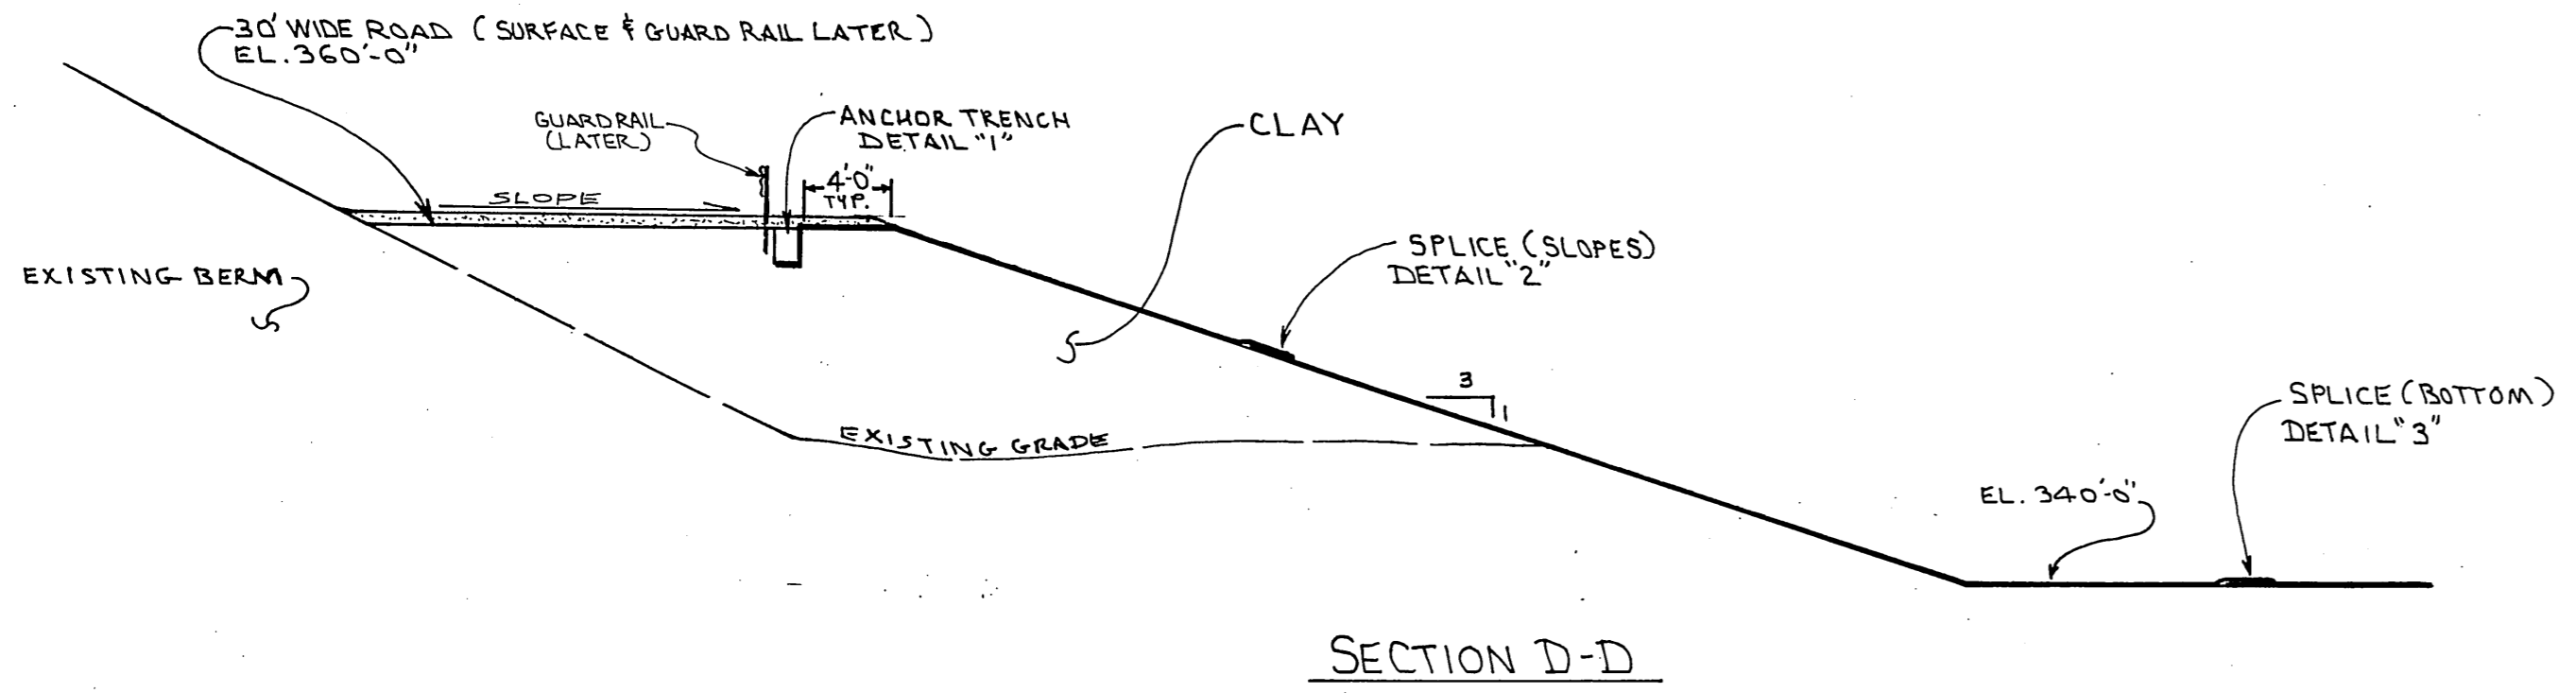

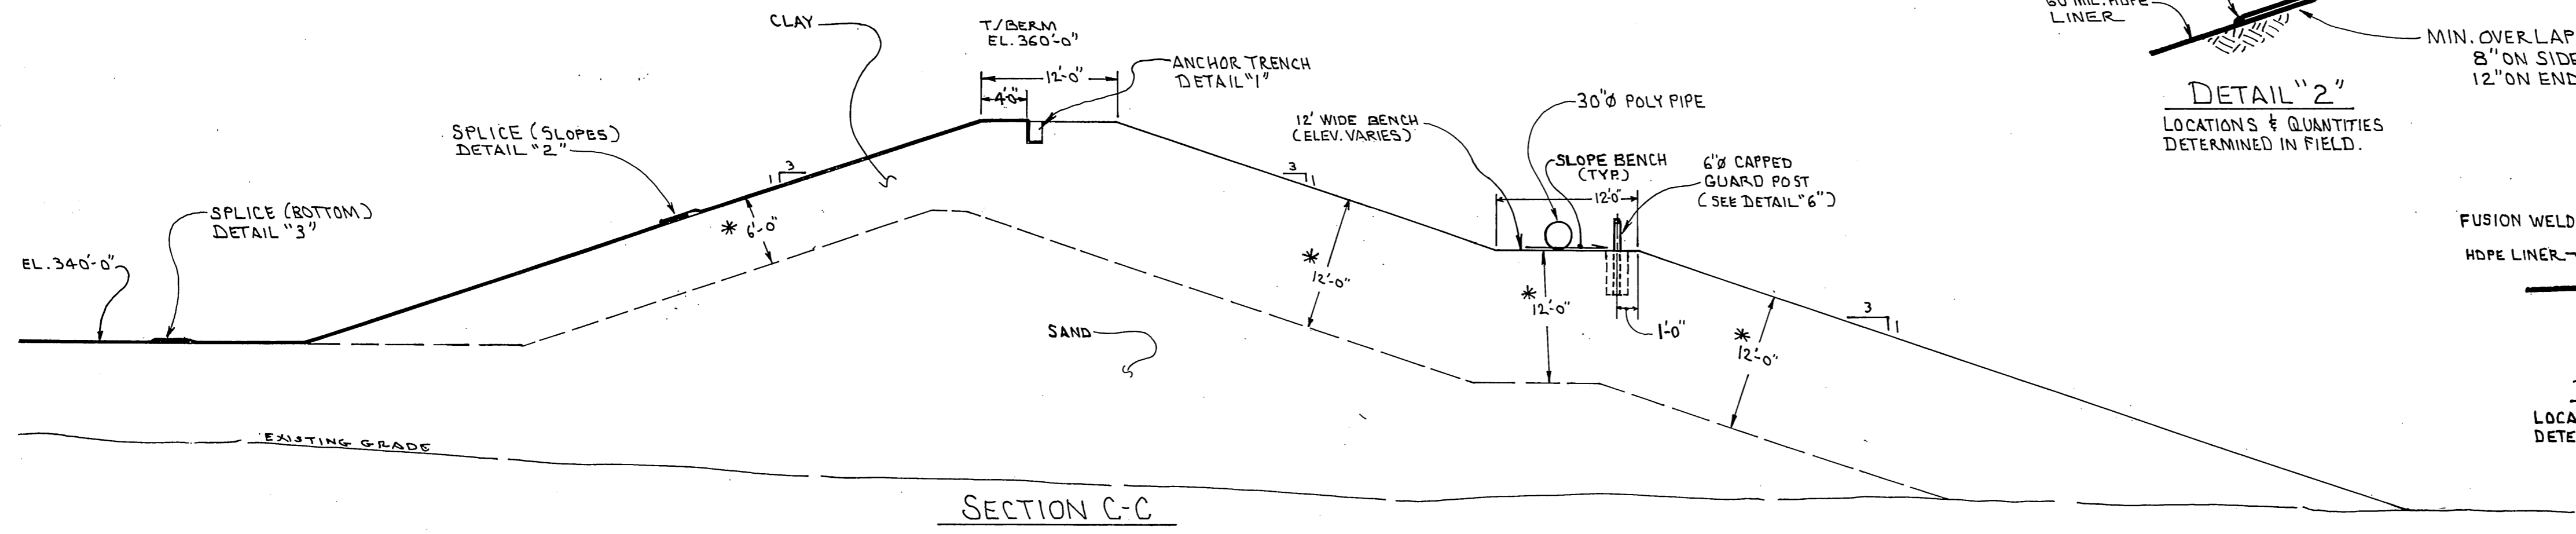

Time	Hydraulic Conductivity, K at 20° C
Min	cm/s
36.0	3.0E-05
42.0	2.9E-05
48.0	3.1E-05
53.0	2.8E-05
Average, Last 4 Readings	<b>3.0E-05</b>

- NOTES:**
- When the level of the ash fines reaches the point where the fines start flowing across the spillway, then bags of sackrete can be installed to raise the spillway elevation.
  - When the level of the ash builds up to approx. elev. 355 along the north and east sides, a french drain system could be installed and drained to this outlet to help hold the water table down. Of course the water level in the storage area would have to be at elev. 351 or above for the french drain to function.
  - This Ash Storage Area has been designed to hold the water level as low as possible so the ash can be piled vertically with dozers, etc. The ash level needs to be approx. 4 ft. to 5 ft. above the water level in order to support heavy equipment.
