Appendix 1 – Groundwater Data Tables and Figures

Appendix 2 – Statistical Analyses

Appendix 3 – Alternate Source Demonstrations

Appendix 4 – Notices for Monitoring Program Transitions

Appendix 5 – Well Installation/Decommissioning Logs

Abbreviations:

ASD - Alternate Source Demonstration
CCR – Coal Combustion Residual
GWPS - Groundwater protection standards
SSI - Statistically Significant Increase
SSL - Statistically Significant Level

I. Overview

This *Annual Groundwater Monitoring and Corrective Action Report* (Report) has been prepared to report the status of activities for the preceding year for an inactive surface impoundment CCR unit at Appalachian Power Company's, a wholly-owned subsidiary of American Electric Power Company (AEP) Clinch River Power Plant. The USEPA's CCR rules require that the Annual Groundwater Monitoring and Corrective Action Report be posted to the operating record by August 1, 2019 and annually thereafter for inactive surface impoundments. The second annual report was prepared on January 31, 2020 to cover the 2019 activities, and future reports will be submitted annually on January 31st. This report is being prepared by January 31, 2022 to cover groundwater monitoring activities in 2021.

In general, the following activities were completed:

- At the start of the current annual monitoring period, Pond 1 was operating under the assessment monitoring program.
- At the end of the current annual reporting period, Pond 1 was operating under the assessment monitoring program.
- An assessment monitoring program was established for Pond 1 on July 15, 2019.
- On October 13, 2019 an Assessment of Corrective Measures (ACM) for Pond 1 was initiated. The ACM was completed on December 11, 2019, and a public meeting to discuss the proposed remedies was held on December 19, 2019.
- Two semi-annual progress report on selecting a remedy pursuant to §257.97 were completed on July 19, 2021 and 1/18/2022. A remedy has not yet been selected, or initiated.
- Data and statistical analysis not available from the previous reporting period indicates that during the October 2020 sampling event:
 - The following Appendix IV parameters exceeded the groundwater protection standards:
 - Barium at well MW-1604
 - Cobalt at wells MW-1607 and MW-1610
 - Lithium at wells MW-1605, MW-1606 and MW-1607
 - Molybdenum at wells MW-1607 and MW-1610
 - The following Appendix III parameters exceeded background concentrations:
 - Calcium at wells MW-1603, MW-1604, MW-1605, and MW-1612
 - Chloride at wells MW-1603, MW-1605, MW-1606, and MW-1607
 - Fluoride at wells MW-1604 and MW-1610

- Sulfate at wells MW-1606 and MW-1607
 - pH at wells MW-1603, MW-1604, MW-1605, MW-1610, and MW-1612
- During the April 2021 semi-annual sampling event
 - The following Appendix IV parameters exceeded established groundwater protection standards:
 - Barium at well MW-1604
 - Cobalt at wells MW-1607 and MW-1610
 - Lithium at wells MW-1605, MW-1606, MW-1607, and MW-1610
 - Molybdenum at wells MW-1607 and MW-1610
 - The following Appendix III parameters exceeded background:
 - Calcium at wells MW-1603, MW-1604, MW-1605, and MW-1612
 - Chloride at wells MW-1603, MW-1605, MW-1606, and MW-1607
 - Fluoride at wells MW-1604 and MW-1610
 - Sulfate at wells MW-1606 and MW-1607
 - TDS at well MW-1603
 - pH at wells MW-1603, MW-1604, MW-1605, and MW-1612
- The October 2021 data are still undergoing statistical analysis.

The major components of this annual report, to the extent applicable at this time, are presented in sections that follow:

- A map, aerial photograph or a drawing showing the CCR management unit(s), all groundwater monitoring wells and monitoring well identification numbers (Attached as **Appendix 1**);
- All of the monitoring data collected, including the rate and direction of groundwater flow, plus a summary showing the number of samples collected per monitoring well, the dates the samples were collected and whether the sample was collected as part of background, detection monitoring, or assessment monitoring programs (Attached as **Appendix 1**);
- Statistical comparison of monitoring data to determine if there have been significant increase over background concentrations (Attached as **Appendix 2**, where applicable);
- A discussion of whether any alternate source demonstrations were performed, and the conclusions (Attached as **Appendix 3**, where applicable);
- A summary of any transition between monitoring programs, for example the date and circumstances for transitioning from detection monitoring to assessment monitoring, in

addition to identifying the constituents detected at a statistically significant increase over background concentrations (Notices Attached as **Appendix 4**, where applicable);

- Identification of any monitoring wells that were installed or decommissioned during the preceding year, along with a statement as to why that happened (Attached as **Appendix 5**, where applicable); and
- Other information required to be included in the annual report such as alternate source demonstration or assessment of corrective measures, if applicable.

In addition, this report summarizes key actions completed, and where applicable, describes any problems encountered and actions taken to resolve those problems. The report includes a projection of key activities for the upcoming year.

II. Groundwater Monitoring Well Locations and Identification Numbers

There are three hydrogeological formations monitored at the facility: the Rome, Chattanooga, and Dumps Fault. The following is a list of wells (S = Shallow zone, D = Deep zone):

Rome Formation

Upgradient wells: MW-1609

Downgradient wells: MW-1606 and MW-1607

Nature and Extent wells: W-1906(S, D); W-1907(S, D), W-1913(S, D)

Chattanooga Formation

Upgradient wells: MW-1601; MW1602; and MW-1608

Downgradient wells: MW-1603; MW-1604; MW-1605; and MW-1612

Nature and Extent wells: W-1903(S, D); W-1904(S, D); W-1905(S, D); and W-2012(S, D)

Dumps Fault Formation

Upgradient wells: MW-1611

Downgradient wells: MW-1610

Nature and Extent wells: W-1910S

A figure that depicts the PE-certified groundwater monitoring network, the monitoring well locations and their corresponding identification numbers is provided in **Appendix 1**.

III. Monitoring Wells Installed or Decommissioned

The network design, as summarized in the *Groundwater Monitoring Network Design Report* (2019) and as posted at the CCR website for Clinch River Plant, did not change. That design report, viewable on the AEP CCR web site, discusses the facility location, the hydrogeological setting,

the hydrostratigraphic units, the uppermost aquifer, downgradient monitoring well locations and the upgradient monitoring well locations.

Since the facility entered assessment monitoring and no alternative source was identified, 13 monitoring wells were installed after initiating the assessment of corrective measures in 2019 to define the horizontal and vertical extent of constituents exceeding the groundwater protection standards at statistically significant levels. Six clusters of shallow and deep wells, and one shallow only well were installed near Dumps Creek and the Clinch River downgradient of the ash pond. The monitoring wells installed at the end of 2019 and were documented in the 2019 annual report. In 2020, two additional monitoring wells were installed to help define the extent of the plume. The monitoring well installation reports for those two wells were included in the 2020 annual report.

IV. Groundwater Quality Data and Static Water Elevation Data, With Flow Rate and Direction Calculations and Discussion

Appendix 1 contains tables showing the groundwater quality data collected during the establishment of background quality, detection and assessment monitoring. Static water elevation data from each monitoring event also are shown in **Appendix 1**, along with the groundwater velocity calculations, groundwater flow direction and potentiometric maps developed after each sampling event.

The sampling event conducted in February 2021 satisfies the requirement of 257.95(b).

V. Groundwater Quality Data Statistical Analysis

Appendix 2 contains the statistical analysis report(s).

- Data and statistical analysis not available from the previous reporting period indicates that during the October 2020 sampling event:
 - The following Appendix IV parameters exceeded the groundwater protection standards:
 - Barium at well MW-1604
 - Cobalt at wells MW-1607 and MW-1610
 - Lithium at wells MW-1605, MW-1606 and MW-1607
 - Molybdenum at wells MW-1607 and MW-1610
 - The following Appendix III parameters exceeded background concentrations:
 - Calcium at wells MW-1603, MW-1604, MW-1605, and MW-1612
 - Chloride at wells MW-1603, MW-1605, MW-1606, and MW-1607
 - Fluoride at wells MW-1604 and MW-1610
 - Sulfate at wells MW-1606 and MW-1607

- pH at wells MW-1603, MW-1604, MW-1605, MW-1610, and MW-1612
- During the April 2021 semi-annual sampling event
 - The following Appendix IV parameters exceeded established groundwater protection standards:
 - Barium at well MW-1604
 - Cobalt at wells MW-1607 and MW-1610
 - Lithium at wells MW-1605, MW-1606, MW-1607, and MW-1610
 - Molybdenum at wells MW-1607 and MW-1610
 - The following Appendix III parameters exceeded background:
 - Calcium at wells MW-1603, MW-1604, MW-1605, and MW-1612
 - Chloride at wells MW-1603, MW-1605, MW-1606, and MW-1607
 - Fluoride at wells MW-1604 and MW-1610
 - Sulfate at wells MW-1606 and MW-1607
 - TDS at well MW-1603
 - pH at wells MW-1603, MW-1604, MW-1605, and MW-1612
- The October 2021 data are still undergoing statistical analysis.

VI. Alternative Source Demonstrations Completed

No alternative source for the groundwater protection standard, or background concentration exceedances has been found at Pond 1, and the CCR unit remains in assessment monitoring and remedies are being evaluated for corrective measures.

VII. Discussion About Transition Between Monitoring Requirements or Alternate Monitoring Frequency

A notification that Pond 1 established an assessment monitoring program was placed in the Operating Record on August 1, 2019 in accordance with the requirement of 257.94(e)(3). Pond 1 also initiated and completed an Assessment of Corrective Measures by December 11, 2019. A public meeting was held on December 19, 2019 to discuss the proposed remedies.

As of the writing of this report, there has been no remedy selected pursuant to § 257.97. Two semi-annual reports discussing the progress towards selecting a remedy have been prepared. The CCR Unit will continue to sample according to the assessment monitoring program.

Regarding defining an alternate monitoring frequency, the groundwater velocity and monitoring well production are high enough at this facility that no modification to the semiannual assessment monitoring frequency is needed.

VIII. Other Information Required

Pond 1 has progressed from detection monitoring to its current status in assessment and corrective action monitoring. As required by the CCR assessment monitoring rules in 40 CFR 257.95 (b) and (d)(1), sampling all CCR wells for the required Appendix III and IV parameters was completed in 2021.

IX. Description of Any Problems Encountered and Actions Taken

No significant problems were encountered. The low flow sampling effort went smoothly and the schedule was met to support the annual groundwater report preparation.

X. A Projection of Key Activities for the Upcoming Year

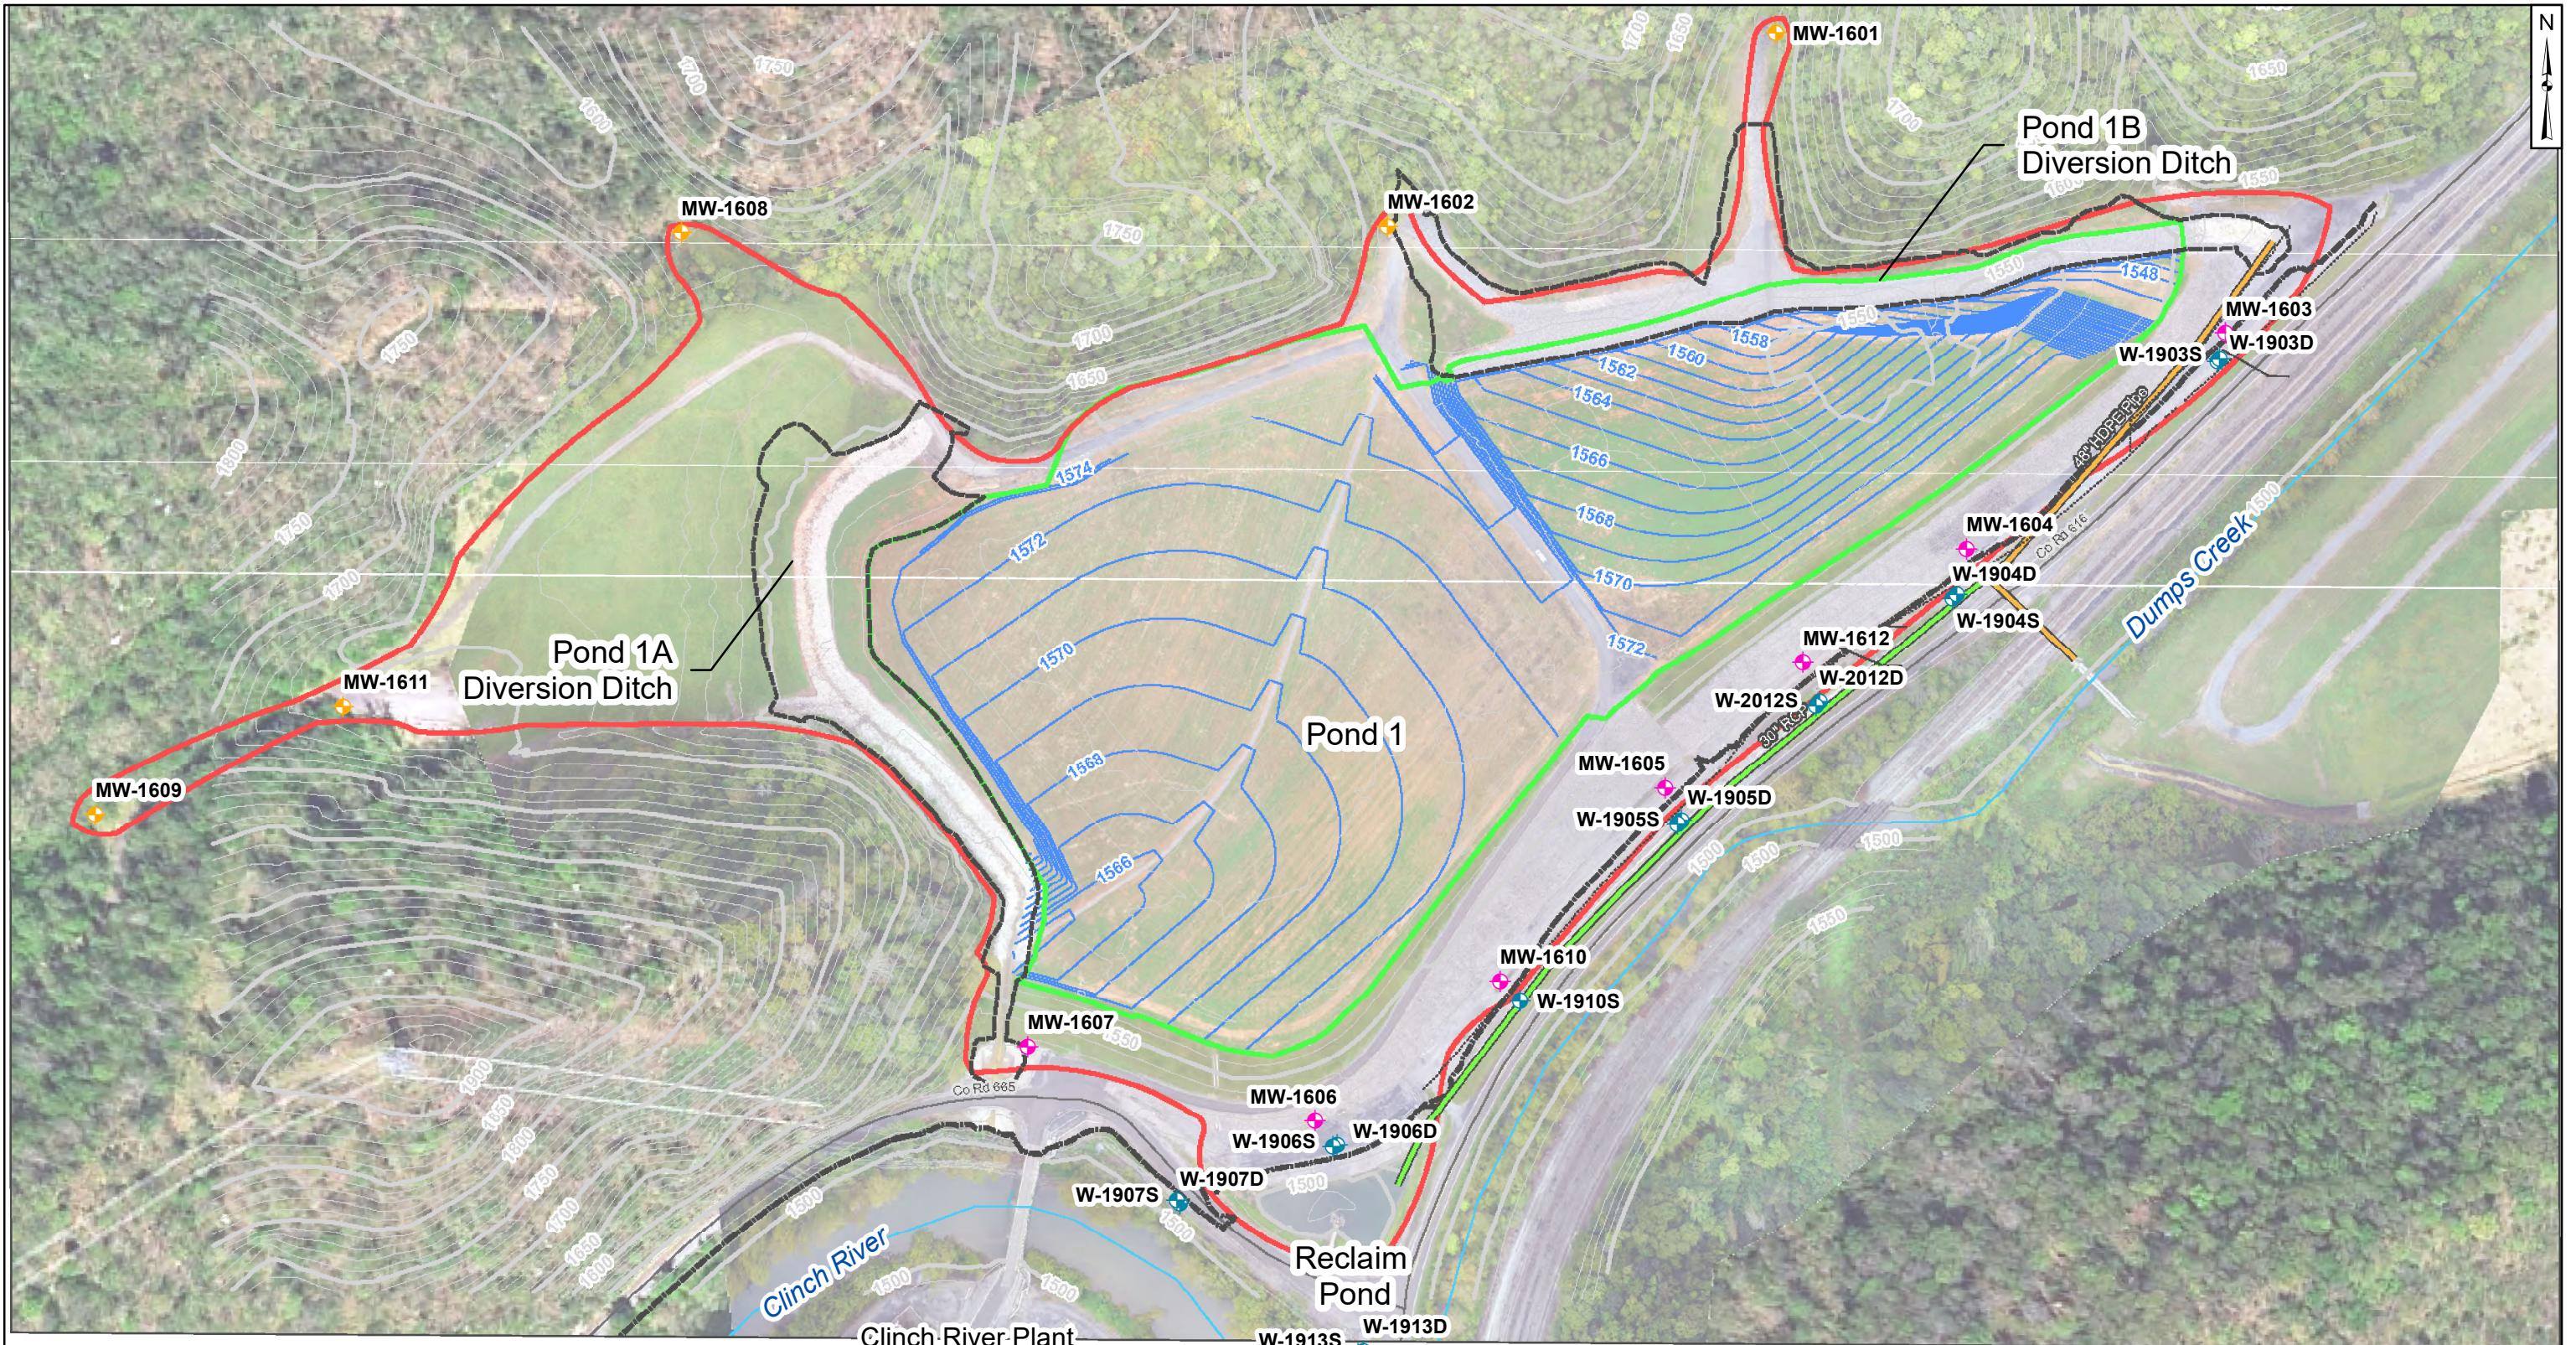

Key activities for 2022 include:

- Assessment monitoring on a twice per year schedule.
- Semi-annual progress report on selecting and designing remedial alternatives.
- Responding to any new data received in light of what the CCR rule requires.
- Preparation of the annual groundwater report.

APPENDIX 1 – Groundwater Data Tables and Figures

Figures and Tables follow, showing the groundwater monitoring network, data collected and the rate and direction of groundwater flow. The dates that the samples were collected and it also is shown whether the data were collected under background, detection, or assessment monitoring.

Groundwater Monitoring Network Figure

Legend

- Upgradient Monitoring Location (Yellow Diamond)
- Downgradient Monitoring Location (Pink Diamond)
- Nature and Extent Well (Blue Diamond)
- Post-Closure Topographic Elevation (Blue Line)
- 100 yr Flood Elevation Approx. 1505 ft amsl (Black Dashed Line)
- Diversion Ditch (Black Dashed Line)
- Facility Boundary (Red Dashed Line)
- Pond 1 CCR Unit Boundary (Green Dashed Line)

Notes

- Aerial basemap provided by AEP.
- Site features based on information available in Groundwater Monitoring Network Evaluation (Amec, 2015).
- Post-Closure Pond Topographic units are feet above mean sea level (ft amsl).

Notes:

mg/L: milligrams per liter

SU: standard unit

<: Non-detect value. Analytes which were not detected are shown as less than the method detection limit (MDL) followed by a 'U1' flag.

In analytical data prior to 5/18/2021, U1 flags were reported as U in the analytical report.

--: Not analyzed

J1: Concentration estimated. Analyte was detected between the method detection limit and the reporting limit.

In analytical data prior to 5/18/2021, J1 flags were reported as J in the analytical report.

In analytical data prior to 5/18/2021, U1 flags were reported as U in the analytical report.

- -: Not analyzed

J1: Concentration estimated. Analyte was detected between the method detection limit and the reporting limit.

In analytical data prior to 5/18/2021, J1 flags were reported as J in the analytical report.

Notes:

µg/L: micrograms per liter

mg/L: milligrams per liter

pCi/L: picocuries per liter

<: Non-detect value. Analytes which were not detected are shown as less than the method detection limit (MDL) followed by a 'U1' flag. In analytical data prior to 5/18/2021, U1 flags were reported as U in the analytical report.

- -: Not analyzed

J1: Concentration estimated. Analyte was detected between the method detection limit and the reporting limit. In analytical data prior to 5/18/2021, J1 flags were reported as J in the analytical report.

Notes:

µg/L: micrograms per liter

mg/L: milligrams per liter

pCi/L: picocuries per liter

<: Non-detect value. Analytes which were not detected are shown as less than the method detection limit (MDL) followed by a 'U1' flag. In analytical data prior to 5/18/2021, U1 flags were reported as U in the analytical report.

- -: Not analyzed

J1: Concentration estimated. Analyte was detected between the method detection limit and the reporting limit. In analytical data prior to 5/18/2021, J1 flags were reported as J in the analytical report.

M1: The associated matrix spike (MS) or matrix spike duplicate (MSD) recovery was outside acceptance limits.

P3: The precision on the matrix spike duplicate (MSD) was above acceptance limits.

10/11/2021	Assessment	< 0.009 U1	71.1	1.40	0.24	7.7	17.0	260

Notes:

mg/L: milligrams per liter

SU: standard unit

<: Non-detect value. Analytes which were not detected are shown as less than the method detection limit (MDL) followed by a 'U1' flag.

In analytical data prior to 5/18/2021, U1 flags were reported as U in the analytical report.

- -: Not analyzed

J1: Concentration estimated. Analyte was detected between the method detection limit and the reporting limit.

In analytical data prior to 5/18/2021, J1 flags were reported as J in the analytical report.

Notes:

µg/L: micrograms per liter

mg/L: milligrams per liter

pCi/L: picocuries per liter

<: Non-detect value. Analytes which were not detected are shown as less than the method detection limit (MDL) followed by a 'U1' flag. In analytical data prior to 5/18/2021, U1 flags were reported as U in the analytical report.

- -: Not analyzed

J1: Concentration estimated. Analyte was detected between the method detection limit and the reporting limit. In analytical data prior to 5/18/2021, J1 flags were reported as J in the analytical report.

SECTION 1

EXECUTIVE SUMMARY

In accordance with the United States Environmental Protection Agency's (USEPA's) regulations regarding the disposal of coal combustion residuals (CCR) in landfills and surface impoundments (40 CFR 257.90-257.98, "CCR rule"), groundwater monitoring has been conducted at Ash Pond 1, an existing CCR unit at the Clinch River Plant located in Carbo, Virginia.

Eight monitoring events were completed from December 2017 to December 2018 to establish background concentrations for Appendix III and Appendix IV parameters under the CCR rule. Data collected through April 2019 were compared to the background concentrations to evaluate whether statistically significant increases (SSIs) or statistically significant levels (SSLs) of Appendix III or Appendix IV constituents, respectively, were identified. An alternative source was not identified, so Ash Pond 1 initiated an assessment of corrective measures in accordance with 40 CFR 257.96 and has been completing assessment monitoring since. During 2020, an annual sampling event for Appendix IV parameters required by 257.95(b) was completed in February, and semi-annual sampling events for Appendix III and the detected Appendix IV parameters required by 257.95(d)(1) were completed in April and October. Statistical analysis of the February and April events was completed previously, and this report summarizes the results of the October 2020 semi-annual assessment monitoring event.

Monitoring data from the October 2020 event underwent several validation tests, including those for completeness, sample tracking accuracy, transcription errors, and consistent use of measurement units. No data quality issues were identified which would impact data usability.

Groundwater data were submitted to Groundwater Stats Consulting, LLC for statistical analysis. The statistics were completed in three separate groups which correspond to differences in the underlying geology at the monitoring locations. Groundwater protection standards (GWPSs) were re-established for the Appendix IV parameters to assess whether Appendix IV parameters were present at an SSL above the GWPS. SSLs were identified for barium, cobalt, lithium, and molybdenum. Thus, the unit will continue the assessment of corrective measures process and will monitor the groundwater monitoring network in accordance with the assessment monitoring program as required by 40 CFR 275.96(b). Certification of the selected statistical methods by a qualified professional engineer is documented in Attachment A.

SECTION 2

ASH POND 1 EVALUATION

2.1 Data Validation & QA/QC

During the assessment monitoring program, one set of samples was collected for analysis from each background and compliance well throughout three geologically distinct monitoring well networks to meet the requirements of 40 CFR 257.95(d)(1) (October 2020). The geological units consist of the Chattanooga Shale, the Rome Limestone, and the Dumps Fault water-bearing unit. Samples from the October 2020 event were analyzed for all Appendix III and Appendix IV parameters. A summary of data collected during this assessment monitoring event may be found in Table 1.

Chemical analysis was completed by an analytical laboratory certified by the National Environmental Laboratory Accreditation Program (NELAP). Quality assurance and quality control (QA/QC) samples completed by the analytical laboratory included the use of laboratory reagent blanks (LRBs), continuing calibration verification (CCV) samples, and laboratory fortified blanks (LFBs).

The analytical data were imported into a Microsoft Access database, where checks were completed to assess the accuracy of sample location information and analyte identification. Where necessary, unit conversions were applied to standardize reported units across all sampling events. Exported data files were created for use with the Sanitas™ v.9.6.27b statistics software. The export file was checked against the analytical data for transcription errors and completeness. No QA/QC issues were noted which would impact data usability.

2.2 Statistical Analysis

Statistical analyses for Ash Pond 1 were conducted in accordance with the October 2020 *Statistical Analysis Plan* (Geosyntec, 2020b), except where noted below. Time series plots and results for all completed statistical tests are provided in Attachment B.

The data obtained in October 2020 were screened for potential outliers. No outliers were identified for this event.

2.2.1 Establishment of GWPSs

A GWPS was established for each Appendix IV parameter in accordance with 40 CFR 257.95(h) and the *Statistical Analysis Plan* (Geosyntec 2020b). The established GWPS was determined to be the greater value of (1) the background concentration and (2) the maximum contaminant level (MCL) or the level specified in 40 CFR 257.95(h)(2) for each Appendix IV parameter. To determine background concentrations, an upper tolerance limit (UTL) was calculated using pooled data from the background wells collected during the background monitoring and assessment

monitoring events. Generally, tolerance limits were calculated parametrically with 95% coverage and 95% confidence. Non-parametric tolerance limits were calculated in instances where data have either non-normal distributions or a high non-detect frequency. Non-parametric tolerance limits for Chattanooga Shale wells were calculated for arsenic, barium, fluoride, lithium, and selenium due to apparent non-normal distributions, and for beryllium, cadmium, mercury, and thallium due to a high non-detect frequency. Non-parametric tolerance limits for Rome Limestone wells were calculated for cadmium and selenium due to apparent non-normal distributions, and for beryllium, mercury, and thallium due to a high non-detect frequency. Non-parametric tolerance limits for Dumps Fault wells were calculated for molybdenum due to apparent non-normal distributions, and for beryllium, cadmium, mercury, and thallium due to a high non-detect frequency. Tolerance limits and the final GWPSs are summarized in Tables 2A-2C.

2.2.2 Evaluation of Potential Appendix IV SSLs

A confidence interval was constructed for each Appendix IV parameter at each compliance well. Confidence limits were generally calculated parametrically ($\alpha = 0.01$); however, non-parametric confidence limits were calculated in some cases (e.g., when the data did not appear to be normally distributed or when the non-detect frequency was too high). An SSL was concluded if the lower confidence limit (LCL) exceeded the GWPS (i.e., if the entire confidence interval exceeded the GWPS). Calculated confidence limits are shown in Attachment B and summarized in Table 3.

The following SSLs were identified at Clinch River Ash Pond 1:

- The LCL for barium at MW-1604 (3.07 mg/L) exceeded the GWPS of 2.00 mg/L, and the LCL for lithium at MW-1605 (0.187 mg/L) exceeded the GWPS of 0.118 mg/L in the Chattanooga Shale formation.
- The LCL for cobalt at MW-1607 (0.00806 mg/L) exceeded the GWPS of 0.00600 mg/L, the LCLs for lithium at MW-1606 (0.0607 mg/L) and MW-1607 (0.118 mg/L) exceeded the GWPS of 0.0400 mg/L, and the LCL for molybdenum at MW-1607 (0.129 mg/L) exceeded the GWPS of 0.100 mg/L in the Rome Limestone formation.
- The LCL for cobalt at MW-1610 (0.00698 mg/L) exceeded the GWPS of 0.00600 mg/L and the LCL for molybdenum at MW-1610 (0.135 mg/L) exceeded the GWPS of 0.100 mg/L in the Dumps Fault water bearing unit.

As a result, Clinch River Ash Pond 1 will continue the assessment of corrective measures and continue to monitor the groundwater monitoring network in accordance with the assessment monitoring program per 40 CFR 257.96(b).

2.2.3 Establishment of Appendix III Prediction Limits

Upper prediction limits (UPL) were previously established for all Appendix III parameters following the background monitoring period (Geosyntec, 2019). As described in the August 2020 *Statistical Analysis Summary* report (Geosyntec, 2020a):

- Intrawell tests were used to evaluate potential SSIs for boron, fluoride, sulfate, and total dissolved solids (TDS) in the Chattanooga Shale formation, whereas interwell tests were used for calcium, chloride, and pH in the Chattanooga Shale formation.
- Intrawell tests were used to evaluate potential SSIs for boron, calcium, fluoride, pH, and TDS in the Rome Limestone formation, whereas interwell tests were used for chloride and sulfate in the Rome Limestone formation.
- Intrawell tests were used to evaluate potential SSIs for all Appendix III parameters in the Dumps Fault formation.

While interwell prediction limits have been updated periodically during the assessment monitoring period as sufficient data became available, this represents the first update to the background dataset for parameters evaluated using intrawell tests.

Mann-Whitney (Wilcoxon rank-sum) tests were performed to determine whether the newer data are affected by a release from the Ash Pond 1. Because the interwell Appendix III limits and the Appendix IV GWPSSs are based on data from upgradient wells which we would not expect to have been impacted by a release, these tests were used for intrawell Appendix III tests only. Mann-Whitney tests were used to compare the medians of historical data (October 2017 – December 2018) to the new compliance samples (February 2019 – April 2020) for the intrawell Appendix III parameters at each formation. Results were evaluated to determine if the medians of the two groups were similar at the 99% confidence level. Where no significant difference was found, the new compliance data were added to the background dataset. Where a statistically significant difference was found between the medians of the two groups, the data were reviewed to evaluate the cause of the difference and to determine if adding newer data to the background dataset, replacing the background dataset with the newer data, or continuing to use the existing background dataset was most appropriate. If the differences appeared to have been caused by a release, then the previous background dataset would have continued to be used.

The complete Mann-Whitney test results and a summary of the significant findings can be found in Attachment B and discussed below:

- For Chattanooga Shale, significant differences were found between the two groups for sulfate in downgradient wells MW-1603, MW-1604, MW-1605, and MW-1612.
- For Rome Limestone, significant differences were found between the two groups for fluoride in upgradient well MW-1609.
- For Dumps Fault, significant differences were found between the groups for boron in downgradient well MW-1610, calcium in upgradient well MW-1611, chloride in upgradient well MW-1611, sulfate in upgradient well MW-1611 and downgradient well MW-1610, and for TDS in upgradient well MW-1611.

Because MW-1609 at Rome Limestone and MW-1610 at Dumps Fault are upgradient monitoring wells and more recent data are similar to background and better represent the groundwater quality upgradient of the facility, the background dataset was updated to include the compliance data for fluoride at MW-1609 and for boron and sulfate at MW-1610. For sulfate in MW-1603, MW-1604, MW-1605, and MW-1612 at Chattanooga Shale, and calcium, chloride, sulfate, and TDS in MW-1611 at Dumps Fault, the test showed significant differences, and the historically data appeared to be substantially higher than the compliance concentrations. In order to best characterize the background well concentration at these downgradient locations, the prediction limits for sulfate in MW-1603, MW-1604, MW-1605, and MW-1612 at Chattanooga Shale and calcium, chloride, sulfate, and TDS in MW-1611 at Dumps Fault were calculated with data from August 2018 through April 2020.

After the revised background set was established, a parametric or non-parametric analysis was selected based on the distribution of the data and the frequency of non-detect data. Estimated results less than the practical quantitation limit (PQL) – i.e., “J-flagged” data – were considered detections and the estimated results were used in the statistical analyses. Non-parametric analyses were selected for datasets with at least 50% non-detect data or datasets that could not be normalized. Parametric analyses were selected for datasets (either transformed or untransformed) that passed the Shapiro-Wilk / Shapiro-Francía test for normality. The Kaplan-Meier non-detect adjustment was applied to datasets with between 15% and 50% non-detect data. For datasets with fewer than 15% non-detect data, non-detect data were replaced with one half of the PQL. The selected analysis (i.e., parametric or non-parametric) and transformation (where applicable) for each background dataset are shown in Attachment B.

Both interwell and intrawell UPLs were calculated for a one-of-two retesting procedure; i.e., if at least one sample in a series of two does not exceed the UPL, then it can be concluded that an SSI has not occurred. In practice, where the initial result did not exceed the UPL, a second sample was not collected. The retesting procedures allowed achieving an acceptably high statistical power to detect changes at downgradient wells for constituents evaluated using intrawell prediction limits.

2.2.4 Evaluation of Potential Appendix III SSIs

While SSLs were identified, a review of the Appendix III results was also completed to assess whether concentrations of Appendix III parameters at the compliance wells exceeded background concentrations. Prediction limits were calculated for the Appendix III parameters to represent background values.

Data collected during the October 2020 assessment monitoring event from downgradient compliance wells were compared to previously calculated prediction limits to evaluate results above background values. The results from this event and the prediction limits are summarized in Tables 4A-4C. The following SSIs above the upper prediction limits (UPLs) were noted:

- Calcium concentrations exceeded the Chattanooga Shale interwell UPL of 8.28 mg/L at MW-1603 (25.7 mg/L), MW-1604 (27.3 mg/L), MW-1605 (43.4 mg/L), and MW-1612 (50.7 mg/L).
- Chloride concentrations exceeded the Chattanooga Shale interwell UPL of 45.8 mg/L at MW-1603 (171 mg/L) and MW-1605 (154 mg/L mg/L).
- Fluoride concentrations exceeded the Chattanooga Shale intrawell UPL of 0.287 mg/L at MW-1604 (0.34 mg/L).
- Chloride concentrations exceeded the Rome Limestone interwell UPL of 3.72 mg/L at MW-1606 (12.9 mg/L) and MW-1607 (7.4 mg/L).
- Sulfate concentrations exceeded the Rome Limestone interwell UPL of 21.0 mg/L at MW-1606 (35.7 mg/L) and MW-1607 (136 mg/L).
- Fluoride concentrations exceeded the Dumps Fault intrawell UPL of 0.227 mg/L at MW-1610 (0.35 mg/L).
- pH values exceeded the Dumps Fault intrawell UPL of 7.9 SU for MW-1610 (8.3 SU).

Additionally, the following statistically significant decreases (SSDs) below the lower prediction limits (LPLs) for pH were noted:

- pH values were below the Chattanooga Shale interwell LPL of 8.0 SU for MW-1603 (7.7 SU), MW-1604 (7.0 SU), MW-1605 (7.6 SU), and MW-1612 (6.8 SU).

While the prediction limits were calculated for a one-of-two or one-of-three retesting procedure, SSIs were conservatively assumed if the initial (October 2020) sample was above the UPL or below the LPL.

2.3 Conclusions

A semi-annual assessment monitoring event was conducted in accordance with the CCR Rule. The laboratory and field data were reviewed prior to statistical analysis, with no QA/QC issues identified that impacted data usability. GWPSs were re-established for the Appendix IV parameters. A confidence interval was constructed at each compliance well for each Appendix IV parameter; SSLs were concluded if the entire confidence interval exceeded the GWPS. SSLs were identified for barium, cobalt, lithium, and molybdenum.

Appendix III parameters were compared to recalculated prediction limits. Calcium, chloride, fluoride, pH, and sulfate results exceeded background levels, and pH results were lower than background levels.

Based on this evaluation, the Clinch River Ash Pond 1 CCR unit will continue with the assessment of corrective measures and continue to monitor the groundwater monitoring network in accordance with the assessment monitoring program per 40 CFR 257.96b.

RE: Clinch River Pond 1 – Assessment Monitoring Report & Background Update – 2020

Dear Ms. Kreinberg,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the statistical evaluation and background update of 2020 groundwater data for American Electric Power Company's Clinch River Pond 1. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals from Electric Utilities (CCR Rule, 2015) as well as with the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began at the Clinch River Pond 1 for the CCR program in 2017 at each of the groundwater monitoring wells. The monitoring well network, as provided by Geosyntec Consultants, consists of the following three formations:

Chattanooga Shale:

Upgradient Wells: MW-1601, MW-1602, MW-1608

Downgradient Wells: MW-1603, MW-1604, MW-1605, MW-1612

Rome Limestone:

Cross-gradient (background) Well: MW-1609

Downgradient Wells: MW-1606, MW-1607

Dumps Fault:

Upgradient Well: MW-1611

Downgradient Well: MW-1610

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Dr. Jim Loftis, Civil & Environmental Engineering professor emeritus at Colorado State University and Senior Advisor to Groundwater Stats Consulting.

The CCR program consists of the following constituents listed below. The terms "constituent" and "parameter" are interchangeable.

- **Appendix III** (Detection Monitoring) - boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Appendix IV** (Assessment Monitoring) – antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, combined radium 226 + 228, fluoride, lead, lithium, mercury, molybdenum, selenium, and thallium

For all constituents, a substitution of the most recent reporting limit is used for nondetect data. In the time series plots, a single reporting limit substitution is used across all wells for a given parameter since the wells are plotted as a group. For calculating introwell prediction limits, the substitution is performed for individual wells and may differ across wells. This generally gives the most conservative limit in each case. Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of well/constituent pairs with 100% nondetects follows this letter.

A separate section is provided for each formation and includes time series plots for Appendix III and IV parameters at all wells within the same formation, for the purpose of screening data (Figure A for each formation). Additionally, box plots are included for all constituents at upgradient and downgradient wells (Figure B for each formation). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells.

Data at all wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method for Appendix III parameters based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when introwell statistical methods are recommended. Power curves are provided to demonstrate that the selected statistical methods for Appendix III parameters comply with the USEPA Unified Guidance recommendations as discussed below.

Summary of Statistical Methods:

Based on the original background screening described in the 2017 screening report, the following statistical methods were selected for Appendix III parameters:

Chattanooga Shale:

- 1) Interwell parametric prediction limits, combined with a 1-of-2 resample plan for calcium, chloride, and pH
- 2) Intrawell parametric prediction limits, combined with a 1-of-2 resample plan for boron, fluoride, sulfate, and TDS

Rome Limestone:

- 1) Interwell prediction limits, combined with a 1-of-2 resample plan for chloride and sulfate
- 2) Intrawell parametric prediction limits, combined with a 1-of-2 resample plan for boron, calcium, fluoride, pH, and TDS

Dumps Fault:

- 1) Intrawell parametric prediction limits, combined with a 1-of-2 resample plan, for boron, calcium, chloride, fluoride, pH, sulfate and TDS

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are nondetects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% per semi-annual event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits. Nondetects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% nondetects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% nondetects in background, simple substitution of one half the reporting limit is utilized in the statistical analysis. The reporting limit

utilized for nondetects is the practical quantification limit (PQL) as reported by the laboratory.

- When data contain between 15-50% nondetects, the Kaplan-Meier nondetect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% nondetects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the introwell case, data for all wells and constituents may be re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of present-day groundwater quality. In the interwell case, prediction limits are updated with upgradient well data following each sampling event after careful screening for any new outliers. In some cases, deselecting the earlier portion of data may be necessary prior to construction of limits so that resulting statistical limits are conservative (i.e. lower) from a regulatory perspective and capable of rapidly detecting changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Summary of Original Background Screening – June 2019

Outlier Evaluation

Time series plots were used to identify suspected outliers, or extreme values that would result in limits that are not conservative from a regulatory perspective, in proposed background data. Suspected outliers at all wells for Appendix III and Appendix IV parameters were formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits. A current list of flagged outliers is included with this report. A discussion of Tukey's test results and individual outliers for each formation is included later in the section for the October 2020 background update.

No distinct seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will

correctly account for the seasonality as a predictable pattern rather than random variation or a release.

While a trend may be visually apparent, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test was used to evaluate all data at each well to identify statistically significant increasing or decreasing trends. In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, earlier data are evaluated to determine whether earlier concentration levels are significantly different than current reported concentrations and will be deselected as necessary. When the historical records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits.

The results of the trend analyses showed that all data are fairly stable over time. A few statistically significant increasing and decreasing trends were noted; however, due to the limited data and the low magnitudes of the trends relative to the average concentrations, no adjustments were required to any data sets at this time. In the case of molybdenum in the Chattanooga Shale formation, it was noted that recent reported concentrations are trending downward across several of the wells. If this pattern continues, it is recommended that historical higher concentrations be deselected in the calculation of the confidence intervals, discussed later in this letter, so that present-day water quality is represented. Results of the trend tests were included with the original screening.

Appendix III – Determination of Spatial Variation

The Analysis of Variance (ANOVA) is used when 2 or more upgradient wells are available to statistically evaluate whether there are significant differences in average concentrations among the wells, and assists in identifying the most appropriate statistical approach. Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells would not be conservative from a regulatory perspective; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter.

For the Chattanooga formation, the ANOVA identified variation for each of the Appendix III parameters, suggesting that an intrawell approach should be considered for these parameters. Data were further evaluated as described below for the appropriateness of intrawell testing.

For the Rome and Dumps Fault formations, the ANOVA could not be used as only one upgradient well is installed at each formation. Therefore, downgradient well data were further evaluated as described below.

Exploratory data analysis was used as a general comparison of concentrations in downgradient wells to concentrations in upgradient wells for all Appendix III parameters recommended for intrawell analyses. Upper tolerance limits (UTLs) were used in conjunction with confidence intervals to determine whether the estimated averages in downgradient wells are higher than observed levels upgradient of the facility. The upper tolerance limits represent the extreme upper range of background levels that may occur at the site when there are no impacts of the facility.

In cases where downgradient average concentrations are higher than the upper limit of observed upgradient concentrations (UTLs) for a given constituent, an independent study and hydrogeological investigation would be required to identify local geochemical conditions and expected groundwater quality for the region to justify an intrawell approach. Such an assessment is beyond the scope of services provided by Groundwater Stats Consulting. When there is not an obvious explanation for observed concentration differences in downgradient wells relative to concentrations in upgradient wells, interwell prediction limits will initially be selected for the statistical method until further evidence shows that concentrations are due to natural variation rather than a result of the facility.

Parametric tolerance limits were constructed with a target of 99% confidence and 95% coverage using all screened upgradient well data for each of the Appendix III parameters. The confidence and coverage levels for nonparametric tolerance limits are dependent upon the number of background samples. As more data are collected, the background population is better represented, and the confidence and coverage levels increase.

Confidence intervals were constructed on all data for each downgradient well for each of the Appendix III parameters, and compared against the tolerance limits discussed above, to determine intrawell eligibility. When the entire confidence interval is above a background standard for a given parameter, interwell methods are initially recommended as the statistical method. Therefore, only parameters with confidence intervals which did not exceed background standards are eligible for intrawell prediction limits.

For the Chattanooga formation, confidence intervals were found to be within their respective limits for boron, fluoride, sulfate and TDS. Those four constituents are, therefore, eligible for intrawell prediction limits. Interwell prediction limits are initially recommended for calcium, chloride and pH due to at least one confidence interval in the downgradient well network exceeding its respective limit.

For the Rome formation, confidence intervals were found to be within their respective limits for boron, calcium, fluoride, pH and TDS making these parameters eligible for intrawell prediction limits. Interwell prediction limits are initially recommended for chloride and sulfate due to at least one confidence interval in the downgradient well network exceeding its respective limit.

For the Dumps Fault formation, all confidence intervals were found to be within their respective limits. Additionally, concentrations in upgradient well MW-1611 are notably higher than concentrations in the downgradient well for all Appendix III constituents other than pH. For pH, upgradient and downgradient levels are very similar. The higher upgradient concentrations would result in interwell prediction limits that are not conservative from a regulatory perspective. Therefore, intrawell prediction limits are recommended for all Dumps Fault Appendix III parameters.

Background Update Summary - Appendix III Constituents – October 2020

Outlier Analysis

Prior to updating background data during this analysis, Tukey's outlier test and visual screening were used to re-evaluate data for outliers at all wells for parameters utilizing intrawell prediction limits, and at all upgradient wells for parameters utilizing interwell prediction limits. When the most recent value is identified as an outlier, values are not flagged in the database at this time as they may represent the beginning of a trend. If future values do not remain at similar concentrations, these values will be flagged as outliers and deselected. Several low values exist in the data sets and appear on the graphs as possible low outliers relative to the laboratory's Practical Quantitation Limit. However, these values are observed trace values (i.e. measurements reported by the laboratory between the Method Detection Limit and the Practical Quantitation Limit) and, therefore, were not flagged as outliers.

Any values flagged as outliers (o-flag) are plotted in a disconnected symbol and lighter font on the time series graph. A substitution of the most recent reporting limit was applied when varying detection limits existed in data.

Tukey's outlier analysis results for upgradient and downgradient wells and outlier summaries for each formation are included with this report in Figure C – Chattanooga Shale, Figure C – Rome Limestone, and Figure C – Dump's Fault. Note that outlier analysis results are combined for Appendix III and Appendix IV constituents. Also note that for the tables of downgradient Tukey's results, the upgradient wells for the same parameters are included for comparison.

Tukey's outlier test on pooled upgradient well data did not identify any potential outliers for any of the formations, and no values were flagged in upgradient wells for Appendix III parameters.

For Chattanooga Shale, Tukey's outlier test identified a high value for TDS in well MW-1605, which was flagged accordingly. For Rome Limestone, Tukey's outlier test identified a high value for TDS in well MW-1607 that was flagged accordingly. Additionally, a similar high value for TDS in well MW-1607 was identified visually and flagged as an outlier in order to generate statistical limits that were conservative (i.e. lower) from a regulatory perspective. For Dumps Fault, Tukey's outlier test did not identify any potential outliers, and no Appendix III values were flagged.

Intrawell Parameters—Mann-Whitney Testing

For parameters that require intrawell prediction limits, the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through December 2018 to the new compliance samples at each well through April 2020 (Figure D). The test evaluates whether the groups are statistically different at the 99% confidence level. If no statistically significant differences are noted, background data may be updated to include more recent data. Complete graphical results of the Mann-Whitney tests are included at the end of this report (Figure D for each of the three formations). Statistically significant differences were identified for the following well/constituent pairs at the following formations:

Chattanooga Shale

- Sulfate: MW-1603, MW-1604, MW-1605, and MW-1612

Rome Limestone

- Fluoride: MW-1609 (upgradient)

Dumps Fault

- Boron: MW-1610
- Calcium: MW-1611 (upgradient)

- Chloride: MW-1611 (upgradient)
- Sulfate: MW-1611 (upgradient) and MW-1610
- TDS: MW-1611 (upgradient)

Typically, when the test concludes that the medians of the two groups are significantly different, particularly in the downgradient wells, the background data are not updated to include the newer data but will be reconsidered in the future. Even though significant Mann-Whitney differences were identified, background data for fluoride in upgradient well MW-1609 at Rome Limestone and for boron and sulfate in well MW-1610 at Dumps Fault were updated with more recent data. In these three cases, compliance data were at lower concentrations than original background data and should generally result in more conservative prediction limits when added to background.

Background limits for other well/constituent pairs with significant results from the Mann-Whitney test (sulfate at downgradient wells MW-1603, MW-1604, MW-1605, and MW-1612 at Chattanooga Shale, and calcium, chloride, sulfate, and TDS in well MW-1611, at Dumps Fault), will utilize the most recent 8 measurements beginning from August 2018 through April 2020. The earlier portions of the records appeared to be substantially higher than the compliance concentrations, and were deselected prior to construction of statistical limits so that limits are more representative of present-day water quality conditions. A list of well/constituent pairs utilizing a truncated portion of their records follows this report (Date Ranges Table).

Intrawell Parameters—Prediction Limits

All available background data through April 2020, except in cases mentioned above, were used to establish intrawell background limits, combined with a 1-of-2 resample plan, that will be used for future comparisons (Figure E for each formation).

Interwell Parameters—Trend Testing

For parameters tested using interwell analyses, the Sen's Slope/Mann-Kendall trend test was used on upgradient wells to determine whether concentrations are statistically increasing, decreasing or stable (Figure F for each formation). Statistically significant trends were identified for the following upgradient well/constituent pairs:

Chattanooga Shale

- Chloride: MW-1608

Rome Limestone

- Chloride: MW-1609

The magnitudes of the trends above are either fairly small relative to average concentrations within each well or would not greatly affect the interwell prediction limits. With limited background samples collected to date, all data from upgradient wells were used to construct interwell prediction limits. As more data are collected, all upgradient well data will be re-evaluated for possible deselection of earlier measurements if they no longer represent present-day groundwater quality conditions.

Interwell Parameters—Prediction Limits

Interwell prediction limits using data through October 2020 for parameters mentioned above, combined with a 1-of-2 resample plan, were constructed from pooled upgradient well data for the Chattanooga Shale and Rome Limestone formations (Figure G for each formation). Downgradient measurements will be compared to these background limits during each subsequent semi-annual sampling event.

Evaluation of Appendix IV Parameters – October 2020

Prior to evaluating Appendix IV parameters, background data in upgradient wells are screened through visual screening and Tukey's outlier test for potential outliers and extreme trending patterns that would lead to artificially elevated statistical limits.

Tukey's outlier test on pooled upgradient well data for Chattanooga Shale and Rome Limestone did not identify any potential outliers, and none were flagged. For Dumps Fault Tukey's test identified a high value of molybdenum for well MW-1611, and this value was flagged. In addition high values for cobalt and lead in well MW-1611 were identified visually and flagged. Summaries of all flagged outliers and Tukey's test results for downgradient and upgradient wells are included in Figure C for each of the three formations

For each Appendix IV parameter and each of the three formations, Interwell upper tolerance limits were used to calculate background limits from all available pooled upgradient well data through October 2020 (Figure H for each formation).

Parametric limits use a target of 95% confidence and 95% coverage. The confidence and coverage levels for nonparametric tolerance limits are dependent upon the number of background samples. These limits were compared to the Maximum Contaminant Levels (MCLs) and CCR-Rule specified levels, as shown in the Groundwater Protection Standards

(GWPS) table following this letter (Figure I for each formation), to determine the highest limit for use as the GWPS in the Confidence Interval comparisons.

Confidence intervals were then constructed for each Appendix IV constituent and each downgradient well using data through October 2020. The confidence intervals were then compared against the GWPS for each constituent to assess compliance. Only when the entire confidence interval is above a GWPS is the well/constituent pair considered to exceed its respective standard. Complete results of the confidence interval analysis follow this letter (Figure J for each formation). The following confidence interval exceedances were identified:

Chattanooga Shale

- Barium: MW-1604
- Lithium: MW-1605

Rome Limestone

- Cobalt: MW-1607
- Lithium: MW-1606 and MW-1607
- Molybdenum: MW-1607

Dumps Fault

- Cobalt: MW-1610
- Molybdenum: MW-1610

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for the Clinch River Pond 1. If you have any questions or comments, please feel free to contact us.

Tukey's Outlier Screening

MW-1603

n = 14

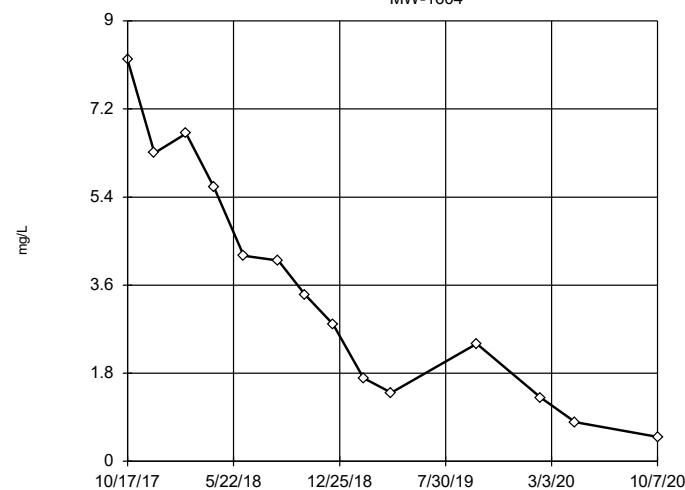

No outliers found.
Tukey's method selected by user.

Data were square root transformed to achieve best W statistic (graph shown in original units).

High cutoff = 189.6, low cutoff = -42.39, based on IQR multiplier of 3.

Tukey's Outlier Screening

MW-1604

n = 14

No outliers found.
Tukey's method selected by user.

Data were cube root transformed to achieve best W statistic (graph shown in original units).

High cutoff = 60.71, low cutoff = -1.042, based on IQR multiplier of 3.

Tukey's Outlier Screening

MW-1605

n = 14

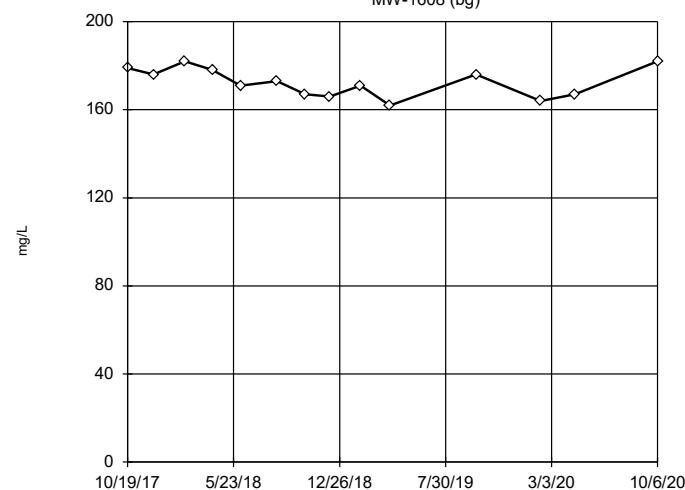

No outliers found.
Tukey's method selected by user.

Data were square transformed to achieve best W statistic (graph shown in original units).

High cutoff = 200, low cutoff = -169.7, based on IQR multiplier of 3.

Tukey's Outlier Screening

MW-1608 (bg)

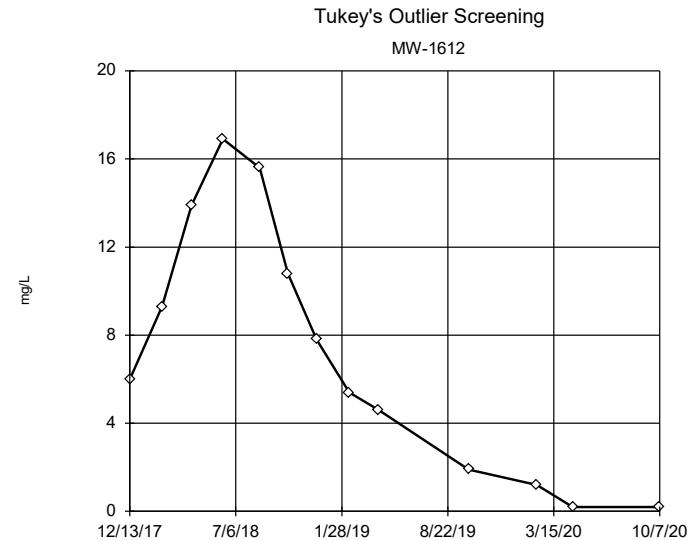

n = 14

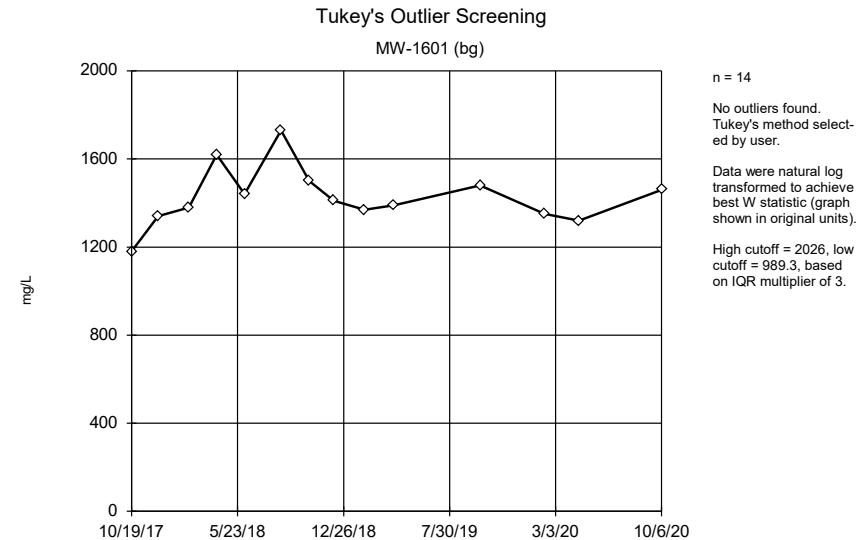

No outliers found.
Tukey's method selected by user.

Data were natural log transformed to achieve best W statistic (graph shown in original units).

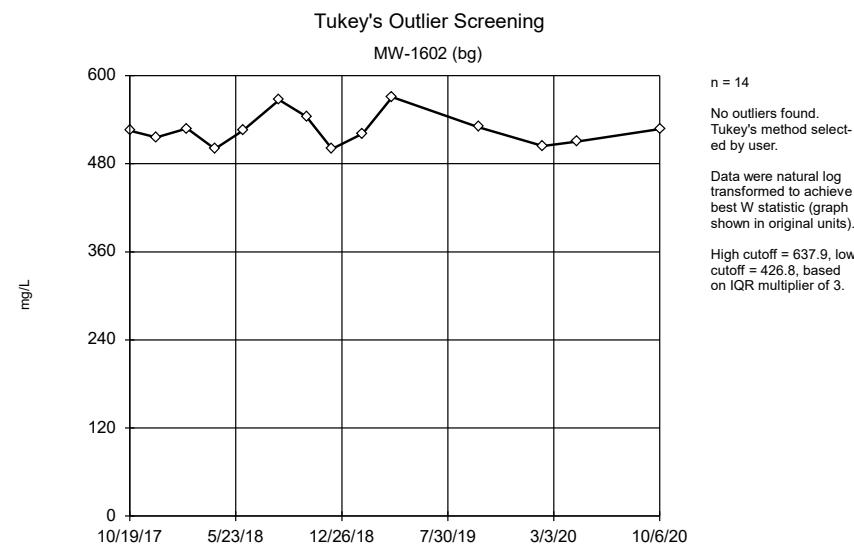

High cutoff = 219.9, low cutoff = 135.1, based on IQR multiplier of 3.

Background Data Summary (based on square root transformation): Mean=1.781, Std. Dev.=0.602, n=42. Normality test: Shapiro Wilk @alpha = 0.01, calculated = 0.9297, critical = 0.922. Kappa = 1.822 (c=7, w=4, 1 of 2, event alpha = 0.05132). Report alpha = 0.007498. Individual comparison alpha = 0.00188. Assumes 4 future values.

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 42 background values. Annual per-constituent alpha = 0.008462. Individual comparison alpha = 0.001062 (1 of 2). Assumes 4 future values.

SECTION 1

EXECUTIVE SUMMARY

In accordance with the United States Environmental Protection Agency's (USEPA's) regulations regarding the disposal of coal combustion residuals (CCR) in landfills and surface impoundments (40 CFR 257.90-257.98, "CCR rule"), groundwater monitoring has been conducted at Ash Pond 1, an existing CCR unit at the Clinch River Plant located in Carbo, Virginia.

Eight monitoring events were completed from December 2017 to December 2018 to establish background concentrations for Appendix III and Appendix IV parameters under the CCR rule. Data collected through April 2019 were compared to the background concentrations to evaluate whether statistically significant increases (SSIs) or statistically significant levels (SSLs) of Appendix III or Appendix IV constituents, respectively, were identified. SSIs for calcium, chloride, sulfate, and pH and SSLs for barium, cobalt, lithium, and molybdenum were identified, and an alternative source for these exceedances were not identified. Therefore, Ash Pond 1 initiated an assessment of corrective measures in accordance with 40 CFR 257.96 and has been completing assessment monitoring since.

During 2021, an annual sampling event for Appendix IV parameters required by 257.95(b) was completed in February, and semi-annual sampling events for Appendix III and the detected Appendix IV parameters required by 257.95(d)(1) were completed in April. The results of the semi-annual assessment monitoring events are documented in this report.

Monitoring data from the February 2021 and April 2021 event underwent several validation tests, including those for completeness, sample tracking accuracy, transcription errors, and consistent use of measurement units. No data quality issues were identified which would impact data usability.

Groundwater data were submitted to Groundwater Stats Consulting, LLC for statistical analysis. The statistics were completed in three separate groups which correspond to differences in the underlying geology at the monitoring locations. Groundwater protection standards (GWPSs) were re-established for the Appendix IV parameters to assess whether Appendix IV parameters were present at an SSL above the GWPS. SSLs were identified for barium, cobalt, lithium, and molybdenum. Thus, the unit will continue the assessment of corrective measures process and will monitor the groundwater monitoring network in accordance with the assessment monitoring program as required by 40 CFR 275.96(b). Certification of the selected statistical methods by a qualified professional engineer is documented in Attachment A.

SECTION 2

ASH POND 1 EVALUATION

2.1 Data Validation & QA/QC

During the assessment monitoring program, two set of samples were collected for analysis from each upgradient and downgradient well throughout the three geologically distinct monitoring well networks to meet the requirements of 40 CFR 257.95b (February 2021) and 257.95(d)(1) (April 2021). The geological units consist of the Chattanooga Shale, the Rome Limestone, and the Dumps Fault water-bearing unit. A summary of data collected during these assessment monitoring events may be found in Table 1.

Chemical analysis was completed by an analytical laboratory certified by the National Environmental Laboratory Accreditation Program (NELAP). Quality assurance and quality control (QA/QC) samples completed by the analytical laboratory included the use of laboratory reagent blanks (LRBs), continuing calibration verification (CCV) samples, and laboratory fortified blanks (LFBs).

The analytical data were imported into a Microsoft Access database, where checks were completed to assess the accuracy of sample location information and analyte identification. Where necessary, unit conversions were applied to standardize reported units across all sampling events. Exported data files were created for use with the Sanitas™ v.9.6.30 statistics software. The export file was checked against the analytical data for transcription errors and completeness. No QA/QC issues were noted which would impact data usability.

2.2 Statistical Analysis

Statistical analyses for Ash Pond 1 were conducted in accordance with the October 2020 *Statistical Analysis Plan* (Geosyntec, 2020). Time series plots and results for all completed statistical tests are provided in Attachment B.

The data obtained in February and April 2021 were screened for potential outliers. No outliers were identified for this event.

2.2.1 Establishment of GWPSs

A GWPS was established for each Appendix IV parameter in accordance with 40 CFR 257.95(h) and the *Statistical Analysis Plan* (Geosyntec 2020) to incorporate data from May 2019 that was previously excluded from the GWPS calculations because it was collected for a detection monitoring verification event. The established GWPSs were determined to be the greater value of (1) the background concentration and (2) the maximum contaminant level (MCL) or the level specified in 40 CFR 257.95(h)(2) for each Appendix IV parameter. To determine background concentrations, an upper tolerance limit (UTL) was calculated using pooled data from the

background wells collected during the background monitoring and assessment monitoring events. Generally, tolerance limits were calculated parametrically with 95% coverage and 95% confidence. Non-parametric tolerance limits were calculated in instances where data have either non-normal distributions or a high non-detect frequency. Non-parametric tolerance limits for Chattanooga Shale wells were calculated for arsenic, barium, fluoride, lithium, and selenium due to apparent non-normal distributions, and for beryllium, cadmium, mercury, and thallium due to a high non-detect frequency. Non-parametric tolerance limits for Rome Limestone wells were calculated for cadmium and lithium due to apparent non-normal distributions, and for beryllium, mercury, and thallium due to a high non-detect frequency. Non-parametric tolerance limits for Dumps Fault wells were calculated for combined radium and molybdenum due to apparent non-normal distributions, and for beryllium, cadmium, mercury, and thallium due to a high non-detect frequency. Tolerance limits and the final GWPSs are summarized in Tables 2A-2C.

2.2.2 Evaluation of Potential Appendix IV SSLs

A confidence interval was constructed for each Appendix IV parameter at each compliance well. Confidence limits were generally calculated parametrically ($\alpha = 0.01$); however, non-parametric confidence limits were calculated in some cases (e.g., when the data did not appear to be normally distributed or when the non-detect frequency was too high). An SSL was concluded if the lower confidence limit (LCL) exceeded the GWPS (i.e., if the entire confidence interval exceeded the GWPS). Calculated confidence limits are shown in Attachment B and summarized in Table 3.

The following SSLs were identified at Clinch River Ash Pond 1:

- The LCL for barium at MW-1604 (3.08 mg/L) exceeded the GWPS of 2.00 mg/L, and the LCL for lithium at MW-1605 (0.186 mg/L) exceeded the GWPS of 0.118 mg/L in the Chattanooga Shale formation.
- The LCL for cobalt at MW-1607 (0.00828 mg/L) exceeded the GWPS of 0.00600 mg/L, the LCLs for lithium at MW-1606 (0.0533 mg/L) and MW-1607 (0.118 mg/L) exceeded the GWPS of 0.0400 mg/L, and the LCL for molybdenum at MW-1607 (0.131 mg/L) exceeded the GWPS of 0.100 mg/L in the Rome Limestone formation.
- The LCL for cobalt at MW-1610 (0.00671 mg/L) exceeded the GWPS of 0.00600 mg/L, the LCL for lithium at MW-1610 (0.173 mg/L) exceeded the GWPS of 0.168 mg/L, and the LCL for molybdenum at MW-1610 (0.139 mg/L) exceeded the GWPS of 0.100 mg/L in the Dumps Fault water-bearing unit.

As a result, Clinch River Ash Pond 1 will continue the assessment of corrective measures and continue to monitor the groundwater monitoring network in accordance with the assessment monitoring program per 40 CFR 257.96(b).

2.2.3 Evaluation of Potential Appendix III SSIs

While SSLs were identified, a review of the Appendix III results was also completed to assess whether concentrations of Appendix III parameters at the compliance wells exceeded background concentrations. Data collected during the April 2021 assessment monitoring event from downgradient compliance wells were compared to previously calculated prediction limits to evaluate results above background values. The results from this event and the prediction limits are summarized in Tables 4A-4C. The following SSIs above the upper prediction limits (UPLs) were noted:

- Calcium concentrations exceeded the Chattanooga Shale interwell UPL of 8.28 mg/L at MW-1603 (33.1 mg/L), MW-1604 (25.8 mg/L), MW-1605 (43.0 mg/L), and MW-1612 (41.6 mg/L).
- Chloride concentrations exceeded the Chattanooga Shale interwell UPL of 45.8 mg/L at MW-1603 (263 mg/L) and MW-1605 (161 mg/L). Chloride concentrations exceeded the Rome Limestone interwell UPL of 3.72 mg/L at MW-1606 (13.4 mg/L) and MW-1607 (6.3 mg/L).
- Fluoride concentrations exceeded the Chattanooga Shale intrawell UPL of 0.287 mg/L at MW-1604 (0.30 mg/L). Fluoride concentrations exceeded the Dumps Fault intrawell UPL of 0.227 mg/L at MW-1610 (0.26 mg/L).
- Sulfate concentrations exceeded the Rome Limestone interwell UPL of 21.0 mg/L at MW-1606 (26.8 mg/L) and MW-1607 (120 mg/L).
- Total dissolved solids (TDS) exceeded the Chattanooga Shale intrawell UPL of 695 mg/L at MW-1603 (848 mg/L).

Additionally, the following statistically significant decreases (SSDs) below the lower prediction limits (LPLs) for pH were noted:

- pH values were below the Chattanooga Shale interwell LPL of 8.0 SU for MW-1603 (7.3 SU), MW-1604 (7.3 SU), MW-1605 (7.9 SU), and MW-1612 (7.3 SU).

While the prediction limits were calculated for a one-of-two or one-of-three retesting procedure, SSIs were conservatively assumed if the initial (April 2021) sample was above the UPL or below the LPL.

2.3 Conclusions

A semi-annual assessment monitoring event was conducted in accordance with the CCR Rule. The laboratory and field data were reviewed prior to statistical analysis, with no QA/QC issues identified that impacted data usability. A review of outliers identified no potential outliers in the February 2021 or April 2021 data. GWPSs were re-established for the Appendix IV parameters to

incorporate May 2019 data. A confidence interval was constructed at each compliance well for each Appendix IV parameter; SSLs were concluded if the entire confidence interval exceeded the GWPS. SSLs were identified for barium, cobalt, lithium, and molybdenum.

Appendix III parameters were compared to previously calculated prediction limits. Calcium, chloride, fluoride, pH, TDS, and sulfate results exceeded background levels, and pH results were lower than background levels.

Based on this evaluation, the Clinch River Ash Pond 1 CCR unit will continue with the assessment of corrective measures and continue to monitor the groundwater monitoring network in accordance with the assessment monitoring program per 40 CFR 257.96b.

RE: Clinch River Pond 1 – Assessment Monitoring Report – 2021

Dear Ms. Kreinberg,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the statistical evaluation of 2021 groundwater data for American Electric Power Company's Clinch River Pond 1. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals from Electric Utilities (CCR Rule, 2015) as well as with the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began at the Clinch River Pond 1 for the CCR program in 2017 at each of the groundwater monitoring wells. The monitoring well network, as provided by Geosyntec Consultants, consists of the following three formations:

Chattanooga Shale:

Upgradient Wells: MW-1601, MW-1602, MW-1608

Downgradient Wells: MW-1603, MW-1604, MW-1605, MW-1612

Rome Limestone:

Cross-gradient (background) Well: MW-1609

Downgradient Wells: MW-1606, MW-1607

Dumps Fault:

Upgradient Well: MW-1611

Downgradient Well: MW-1610

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Dr. Jim Loftis, Civil & Environmental Engineering professor emeritus at Colorado State University and Senior Advisor to Groundwater Stats Consulting

The CCR program consists of the following constituents listed below. The terms "constituent" and "parameter" are interchangeable.

- **Appendix IV** (Assessment Monitoring) – antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, combined radium 226 + 228, fluoride, lead, lithium, mercury, molybdenum, selenium, and thallium

For all constituents, a substitution of the most recent reporting limit is used for non-detect data. In the time series plots, a single reporting limit substitution is used across all wells for a given parameter since the wells are plotted as a group. For calculating introwell prediction limits, the substitution is performed for individual wells and may differ across wells. This generally gives the most conservative limit in each case. Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of well/constituent pairs with 100% non-detects for the Chattanooga Shale formation follows this letter. Both the Dumps Fault and Rome Limestone formations did not have any well/constituent pairs with 100% non-detects.

A separate section is provided for each formation and includes time series plots for Appendix IV parameters at all wells within the same formation, for the purpose of screening data (Figure A for each formation). Additionally, box plots are included for all constituents at upgradient and downgradient wells (Figure B for each formation). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells.

Summary of Statistical Methods:

Parametric tolerance limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (USEPA, 2009), data are analyzed using either parametric or non-parametric prediction limits as appropriate. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects in background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric tolerance limits are used on data containing greater than 50% non-detects.

Evaluation of Appendix IV Parameters – April 2021 Sampling Event

Prior to constructing statistical limits, data at all wells are screened through April 2021 using time series plots to identify outliers and extreme trending patterns that would lead to artificially elevated statistical limits. For the downgradient well data that are used to construct confidence intervals, a regulatory conservative approach is taken in that values that are marginally high relative to the rest of the data are retained unless there is particular justification for excluding them. No new suspected outliers were identified during this analysis. Any previously flagged values, as discussed below, may be seen on the Outlier Summary table for each formation following this letter.

Tukey's outlier test on pooled upgradient well data for Chattanooga Shale and Rome Limestone did not identify any potential outliers, and none were flagged. For Dumps Fault Tukey's test identified a high value of molybdenum for well MW-1611, and this value was flagged. In addition, high values for cobalt and lead in well MW-1611 were identified visually and flagged. Values identified as outliers are flagged with "o" and displayed in a lighter font and disconnected symbol on the time series graphs. Summaries of all flagged outliers are included in Figure C for each of the three formations.

For each Appendix IV parameter and each of the three formations, interwell upper tolerance limits were calculated to create background limits from all available pooled upgradient well data through October 2020. Since the previous background update conducted in February 2021, additional samples were provided by Geosyntec from the May 2019 sample event, and these samples were included in the construction of the tolerance limits during this analysis. Parametric limits use a target of 95% confidence and 95% coverage (Figure D). The confidence and coverage levels for nonparametric tolerance limits are dependent upon the number of background samples. Interwell upper tolerance

using limits were compared to the Maximum Contaminant Levels (MCLs) and CCR-Rule specified levels, as shown in the Groundwater Protection Standards (GWPS) table following this letter (Figure E for each formation), to determine the highest limit for use as the GWPS in the Confidence Interval comparisons.

Confidence intervals were then constructed for each Appendix IV constituent and each downgradient well using data through April 2021 (Figure F for each formation). The confidence intervals were then compared against the GWPS for each constituent to assess compliance. Only when the entire confidence interval is above a GWPS is the well/constituent pair considered to exceed its respective standard. Complete results of the confidence interval analysis follow this letter. The following confidence interval exceedances were identified:

Chattanooga Shale

- Barium: MW-1604
- Lithium: MW-1605

Rome Limestone

- Cobalt: MW-1607
- Lithium: MW-1606 and MW-1607
- Molybdenum: MW-1607

Dumps Fault

- Cobalt: MW-1610
- Lithium: MW-1610
- Molybdenum: MW-1610

Note that for lithium in MW-1610 at the Dumps Fault formation, the lower confidence limit, when rounded to 2 significant figures, is equal to the GWPS. Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for the Clinch River Pond 1. If you have any questions or comments, please feel free to contact us.

Constituent: Barium total Analysis Run 8/12/2021 10:26 AM View: Dumps Fault - Pond 1 UTLS
Clinch River LF Client: AEP Data: Clinch River

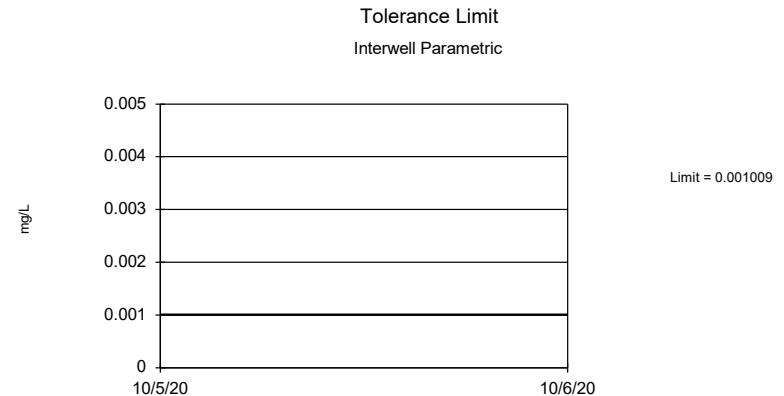

Non-parametric test used in lieu of parametric tolerance limit because censored data exceeded 50%. Limit is highest of 15 background values. 66.67% NDs. 73.63% coverage at alpha=0.01; 81.84% coverage at alpha=0.05; 95.51% coverage at alpha=0.5. Report alpha = 0.4633.

Constituent: Beryllium total Analysis Run 8/12/2021 10:26 AM View: Dumps Fault - Pond 1 UTLS
Clinch River LF Client: AEP Data: Clinch River

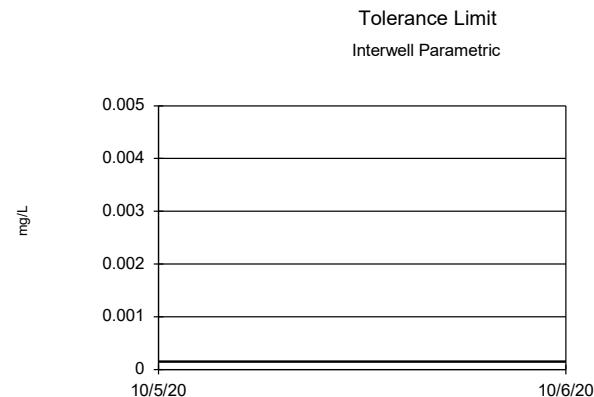

Non-parametric test used in lieu of parametric tolerance limit because censored data exceeded 50%. Limit is highest of 15 background values. 93.33% NDs. 73.63% coverage at alpha=0.01; 81.84% coverage at alpha=0.05; 95.51% coverage at alpha=0.5. Report alpha = 0.4633.

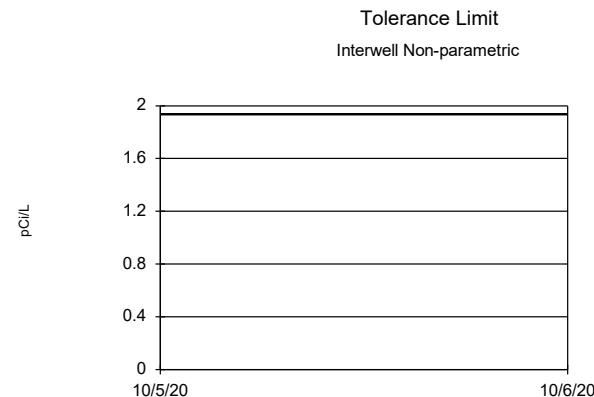

95% coverage. Background Data Summary: Mean=0.0004683, Std. Dev.=0.0002105, n=15. Normality test: Shapiro Wilk @alpha = 0.01, calculated = 0.9232, critical = 0.835. Report alpha = 0.05.

Constituent: Cadmium total Analysis Run 8/12/2021 10:26 AM View: Dumps Fault - Pond 1 UTLS
Clinch River LF Client: AEP Data: Clinch River

Constituent: Chromium total Analysis Run 8/12/2021 10:26 AM View: Dumps Fault - Pond 1 UTLS
Clinch River LF Client: AEP Data: Clinch River

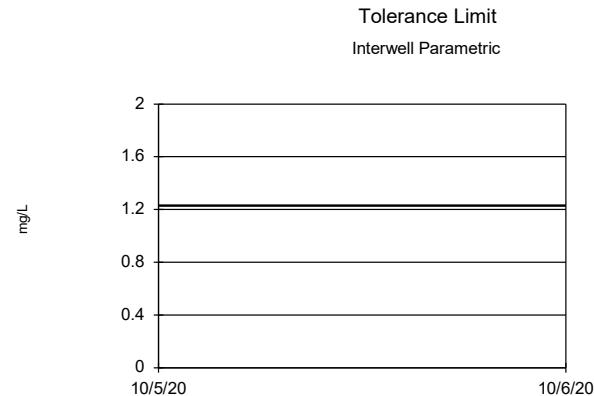

95% coverage. Background Data Summary: Mean=0.00006436, Std. Dev.=0.0000336, n=14. Normality test: Shapiro Wilk @alpha = 0.01, calculated = 0.9223, critical = 0.825. Report alpha = 0.05.

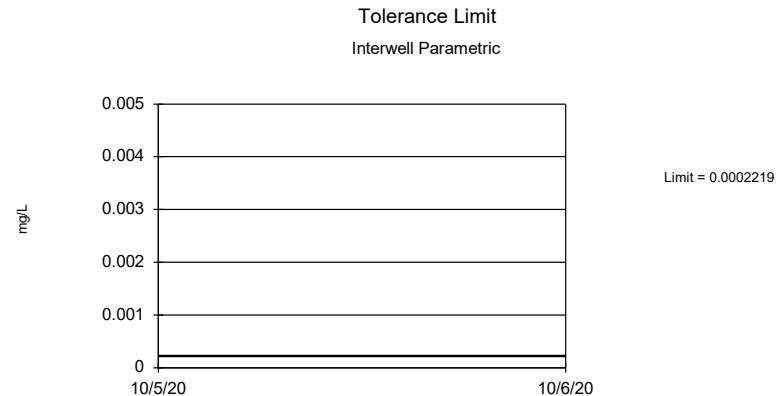

Non-parametric test used in lieu of parametric tolerance limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 15 background values. 73.63% coverage at alpha=0.01; 81.84% coverage at alpha=0.05; 95.51% coverage at alpha=0.5. Report alpha = 0.4633.

Constituent: Cobalt total Analysis Run 8/12/2021 10:26 AM View: Dumps Fault - Pond 1 UTLS
Clinch River LF Client: AEP Data: Clinch River

Constituent: Combined Radium 226 and 228 Analysis Run 8/12/2021 10:26 AM View: Dumps Fault - Pond
Clinch River LF Client: AEP Data: Clinch River

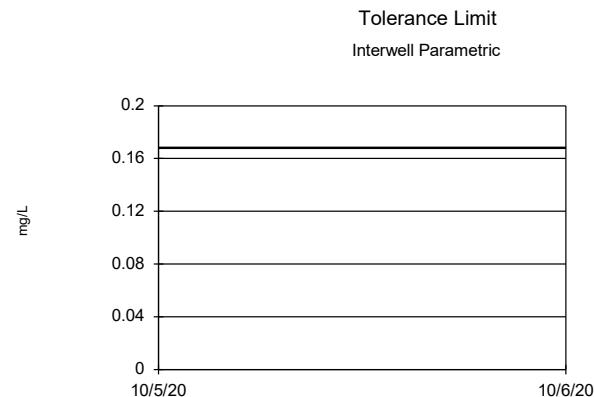

95% coverage. Background Data Summary (based on square transformation): Mean=0.8323, Std. Dev.=0.2654, n=15. Normality test: Shapiro Wilk @alpha = 0.01, calculated = 0.8823, critical = 0.835. Report alpha = 0.05.

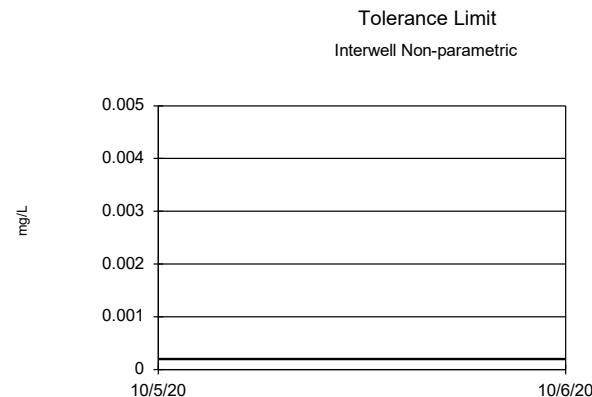

95% coverage. Background Data Summary: Mean=0.00009664, Std. Dev.=0.00004791, n=14, 14.29% NDs. Normality test: Shapiro Wilk @alpha = 0.01, calculated = 0.938, critical = 0.825. Report alpha = 0.05.

Constituent: Fluoride total Analysis Run 8/12/2021 10:26 AM View: Dumps Fault - Pond 1 UTLS
Clinch River LF Client: AEP Data: Clinch River

Constituent: Lead total Analysis Run 8/12/2021 10:26 AM View: Dumps Fault - Pond 1 UTLS
Clinch River LF Client: AEP Data: Clinch River

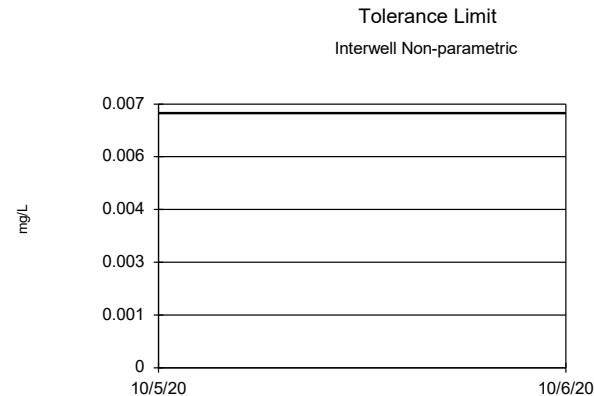

95% coverage. Background Data Summary: Mean=0.09203, Std. Dev.=0.02968, n=15. Normality test: Shapiro Wilk @alpha = 0.01, calculated = 0.8686, critical = 0.835. Report alpha = 0.05.

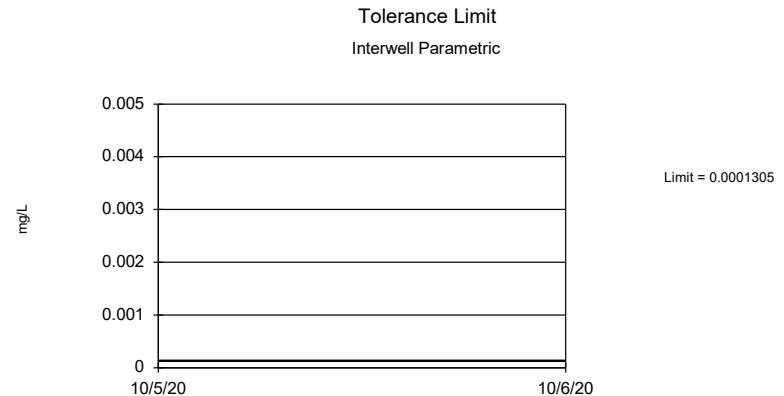

Non-parametric test used in lieu of parametric tolerance limit because censored data exceeded 50%. Limit is highest of 15 background values. 93.33% NDs. 73.63% coverage at alpha=0.01; 81.84% coverage at alpha=0.05; 95.51% coverage at alpha=0.5. Report alpha = 0.4633.

Constituent: Lithium total Analysis Run 8/12/2021 10:26 AM View: Dumps Fault - Pond 1 UTLS
Clinch River LF Client: AEP Data: Clinch River

Constituent: Mercury total Analysis Run 8/12/2021 10:26 AM View: Dumps Fault - Pond 1 UTLS
Clinch River LF Client: AEP Data: Clinch River

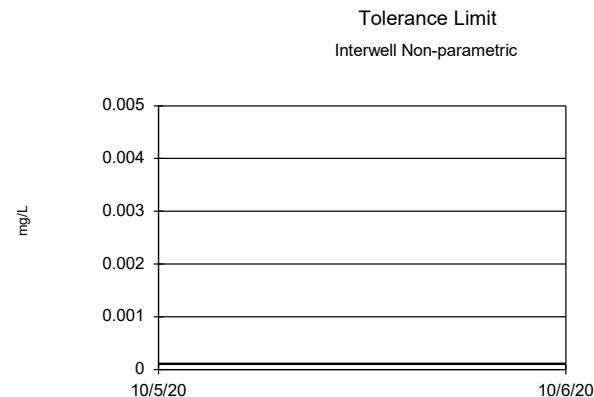

Non-parametric test used in lieu of parametric tolerance limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 14 background values. 72.07% coverage at alpha=0.01; 80.66% coverage at alpha=0.05; 95.12% coverage at alpha=0.5. Report alpha = 0.4877.

95% coverage. Background Data Summary: Mean=0.00006733, Std. Dev.=0.00002463, n=15. Normality test: Shapiro Wilk @alpha = 0.01, calculated = 0.8396, critical = 0.835. Report alpha = 0.05.

Constituent: Molybdenum total Analysis Run 8/12/2021 10:26 AM View: Dumps Fault - Pond 1 UTLs
Clinch River LF Client: AEP Data: Clinch River

Constituent: Selenium total Analysis Run 8/12/2021 10:26 AM View: Dumps Fault - Pond 1 UTLs
Clinch River LF Client: AEP Data: Clinch River

Non-parametric test used in lieu of parametric tolerance limit because censored data exceeded 50%. Limit is highest of 15 background values. 80% NDs. 73.63% coverage at alpha=0.01; 81.84% coverage at alpha=0.05; 95.51% coverage at alpha=0.5. Report alpha = 0.4633.

Constituent: Thallium total Analysis Run 8/12/2021 10:26 AM View: Dumps Fault - Pond 1 UTLs
Clinch River LF Client: AEP Data: Clinch River

APPENDIX 3 – Alternate Source Demonstrations

No new alternate source demonstrations have been completed as of January 31, 2022.

APPENDIX 4 – Notices for Monitoring Program Transitions

The notification that an assessment monitoring program and assessment of corrective measure was initiated follows.

Clinch River Plant
Notice of Assessment Monitoring Program Establishment
Pond 1 CCR Management Unit

On July 15, 2019, it was determined that Clinch River Plant's Pond 1 had statistically significant increases over background for calcium, chloride and sulfate and a statistically significant decrease for pH.

Clinch River Pond 1 was officially closed on August 6, 2018 under a Solid Waste Permit issued by Virginia Department of Environmental Quality. The State solid waste permit included a groundwater monitoring program that required the groundwater to be sampled and analyzed for Appendix III, Appendix IV and additional State parameters immediately following the collection of background. Under the State statistical methods, the statistical analysis of the first compliance sampling event indicated statistical significant increases above groundwater protection standards for cobalt, lithium, molybdenum, nickel, lead and barium. Nickel and lead are State-only parameters.

Based on the results of the State statistical analysis, Appalachian Power Company made the decision to statistically evaluate Appendix IV parameters during the first Federal CCR detection monitoring event. This evaluation following Federal statistical analysis methods, indicated statistical significant increases above groundwater protection standards for barium, cobalt, lithium and molybdenum. This evaluation can be found as Appendix 2 of the Annual Groundwater Report dated August 1, 2019.

At this point, no alternate source demonstration (ASD) for Appendix III parameters will be completed in accordance with §257.94(e)(2), prompting the initiation of an assessment monitoring program, which was established on July 15, 2019. Therefore this notice is being placed in the operating record in accordance with the requirement of 257.94(e)(3). If a successful ASD is completed for the Appendix IV exceedances then an ASD will be completed for the Appendix III parameters.

Clinch River Plant

Notice for Initiating an Assessment of Corrective Measures

CCR Unit – Pond 1

This notice is being provided, as required by 40 CFR 257.95(g)(5), that an Assessment of Corrective Measures was initiated on October 13, 2019 for Clinch River Plant's Pond 1 due to the statistically significant concentrations detected above the established groundwater protection standards for cobalt, lithium, molybdenum and barium.

APPENDIX 5 – Well Installation/Decommissioning Logs

No new wells were installed or decommissioned during the reporting period.
