LPL	lower prediction limit
mg/L	milligrams per liter
SSI	statistically significant increase
TAC	Texas Administrative Code
TCEQ	Texas Commission on Environmental Quality
UPL	upper prediction limit

## 1. INTRODUCTION AND SUMMARY

This alternative source demonstration (ASD) report has been prepared to address statistically significant increases (SSIs) for boron and chloride in the groundwater monitoring network at the H.W. Pirkey Plant Landfill (Landfill) in Hallsville, Texas, following the first semiannual detection monitoring event of 2024. The H.W. Pirkey Plant has four coal combustion residuals (CCR) storage units regulated by the Texas Commission on Environmental Quality (TCEQ) under Registration No. CCR104, including the Landfill (**Figure 1**). The western side of the Landfill overlies a former lignite mining area, as shown on **Figure 2**.

Background groundwater concentrations for the Landfill were initially calculated in January 2018 with data from at least eight monitoring events (Geosyntec 2018). Upper prediction limits (UPLs) were calculated for each Appendix III parameter to represent background values. Lower prediction limits (LPLs) were also calculated for pH.

Because of the presence of lignite mine spoils within the screened interval at downgradient well AD-34, an ASD was certified on January 7, 2020 which resulted in a switch in the groundwater monitoring network statistics from interwell tests to intrawell tests for evaluation of pH, sulfate, and total dissolved solids prediction limits for all wells (Geosyntec 2020). The intrawell prediction limits were updated once sufficient data could be incorporated into the background data set (Geosyntec 2021). After a minimum of four additional detection monitoring events were completed, the prediction limits were recalculated based on a one-of-two retesting procedure to maintain an appropriate site-wide false positive rate (Geosyntec 2024a). With this procedure, an SSI is concluded only if both samples in a series of two exceed the UPL or, in the case of pH, are below the LPL.

The first semiannual detection monitoring event of 2024 was performed in April 2024, and the results were compared to the calculated prediction limits in accordance with Texas Administrative Code (TAC) Title 30, §352.941(a) [30 TAC §352.941(a)]. Where initial exceedances were identified, verification resampling was completed in June 2024. Following verification resampling, SSIs were identified for boron at well AD-23 and chloride at AD-36 by intrawell analysis (Geosyntec 2024b). A summary of the detection monitoring analytical results for the downgradient compliance wells and the calculated prediction limits to which they were compared is provided in **Table 1**. The laboratory analytical reports can be found in **Attachment A**.

### 1.1 CCR Rule Requirements

TCEQ regulations regarding detection monitoring programs for CCR landfills and surface impoundments provide owners and operators with the option to make an ASD when an SSI is identified:

In making a demonstration under this section, the owner or operator must . . . within 90 days of making a determination of an SSI over the background value for any Appendix III constituent adopted by reference in §352.1421 of this title, submit a report prepared and certified in accordance with §352.4 of this title (relating to Engineering and Geoscientific Information), to the executive director, and any local pollution agency with jurisdiction that has requested to be notified, demonstrating that a source other than a coal combustion residuals unit caused the SSI or that the SSI resulted from error in sampling, analysis,

statistical evaluation, or natural variation in groundwater quality. (30 TAC §352.941(c)(2)).

Pursuant to 30 TAC §352.941(c)(2), Geosyntec Consultants, Inc. (Geosyntec) has prepared this ASD report on behalf of American Electric Power (AEP) to document that the SSIs identified for boron and chloride in the groundwater monitoring network for the Landfill are from a source other than the Landfill.

## **1.2 Demonstration of Alternative Sources**

An evaluation was completed to assess possible alternative sources to which the identified SSIs could be attributed. Alternative sources were categorized into the following five types, based on methods provided by the Electric Power Research Institute (EPRI 2017):

- ASD Type I: Sampling Causes
- ASD Type II: Laboratory Causes
- ASD Type III: Statistical Evaluation Causes
- ASD Type IV: Natural Variation
- ASD Type V: Alternative Sources (i.e., anthropogenic impacts)

A demonstration was conducted to show that the SSIs identified for boron and chloride were based on a Type IV cause and not by a release from the Pirkey Landfill.

## 2. SUMMARY OF SITE CONDITIONS

The Landfill design and construction, regional geology and site hydrogeology, and groundwater monitoring network and flow conditions are described below.

### 2.1 Landfill Design and Construction

The Pirkey Landfill was designed to receive CCR materials including fly ash, bottom ash, economizer ash, and stabilized flue gas desulfurization sludge (Arcadis 2022). The Landfill consists of cells which have been constructed periodically since 1984, when the first cell was developed at the northeastern corner of the Landfill. The most recent cell that has been developed was constructed at the southeast corner of the Landfill beginning in 2018. The Landfill is now approximately 134 acres in size.

The Landfill was constructed within an unnamed tributary creek, and the base of the Landfill is partially excavated into the creek bed (Arcadis 2022). Earthen embankments were installed around portions of the Landfill to control stormwater flow. Leachate is drained from the Landfill via bottom area drains and collection pipes installed at the base of the Landfill. From previous investigations of the Landfill summarized by Arcadis (2022), the Landfill was constructed with an engineered liner. The initial cells included a 3-foot thick compacted soil liner. In 1995, the design was modified to include a 60-mil thick high-density polyethylene (HDPE) geomembrane liner overlying a geosynthetic clay liner. The most recent cell was constructed with a single-composite liner system consisting of, from top to bottom: a 2-foot thick leachate drainage layer; a 60-mil thick HDPE geomembrane liner; and a 2-foot thick compacted clay liner (Akron Consulting, LLC 2022).

As of November 2023, the 2018 expansion is the only cell still actively receiving waste. The approximate area of active waste placement is shown in **Figure 2**. The remainder of the Landfill is either considered closed and covered by a final vegetative cover or closure turf material or considered inactive with temporary soil cover (AEP 2023).

### 2.2 Regional Geology / Site Hydrogeology

The Landfill is positioned on an outcrop of the Eocene-age Recklaw Formation, which consists predominantly of clay and fine-grained sand (Arcadis 2022). The Recklaw Formation is underlain by the Carrizo Sand, which crops out in the topographically lower southern portion of the plant. The Carrizo Sand consists of fine- to medium-grained sand interbedded with silt and clay.

The Landfill monitoring well network monitors groundwater within the uppermost aquifer, which was defined by Arcadis (2022) as very-fine- to fine-grained clayey and silty sand located below and adjacent to the Landfill, between an elevation of approximately 270 and 330 feet above mean sea level. Cross sections and a cross-section location map from the Arcadis Monitoring Well Network Report (2022) are provided as **Attachment B**. Geologic cross sections C-C' and D-D' show the subsurface structure of the uppermost aquifer (indicated as clayey silty sand, brown to gray) underlying the Landfill. These geologic cross sections also demonstrate lateral continuity of the uppermost aquifer, spanning both directions underneath the entire length of the Landfill.

### 2.3 Groundwater Monitoring Network and Flow Conditions

The Landfill monitoring well network consists of upgradient monitoring wells AD-8, AD-12, AD-16, and AD-27, and downgradient compliance wells AD-23, AD-34, and AD-36. AD-36 was

installed in April 2019 (after the initial monitoring well network was already in place) as a replacement for well AD-35, which was decommissioned in November 2018 due to the Landfill expansion (Arcadis 2022). The groundwater flow direction near the Landfill is southwesterly (**Figure 1**). Seasonal variability in groundwater flow direction has not been observed since the monitoring well network was installed.

### 3. ALTERNATIVE SOURCE DEMONSTRATION

The ASD evaluation method and proposed alternative source of boron in AD-23 and chloride in AD-36 and the future groundwater sampling requirements are described below.

#### 3.1 Proposed Alternative Source

An initial review of site geochemistry, site historical data, and laboratory quality assurance and quality control data did not identify an alternative source for boron or chloride due to Type I (sampling), Type II (laboratory), Type III (statistical evaluation), or Type V (anthropogenic impact) issues. Groundwater sampling, laboratory analysis, and statistical evaluations were generally completed in accordance with 30 TAC §352.931(a) and the draft TCEQ guidance for groundwater monitoring (TCEQ 2020). Based on a review of groundwater data and recent site construction events, the SSIs for boron and chloride were attributed to natural variation associated with naturally occurring aqueous boron and chloride concentrations within the aquifer unit beneath the Landfill, which is a Type IV issue.

##### 3.1.1 Boron

An SSI for boron was observed at downgradient monitoring well AD-23. The boron concentration at AD-23 observed during the initial sampling event (0.207 milligrams per liter [mg/L]) exceeded the UPL of 0.0612 mg/L. The June verification event confirmed the exceedance, with a boron concentration of 0.242 mg/L. Boron concentrations at AD-23 are within the range of those observed at other wells in the groundwater monitoring network (**Figure 3**). Upgradient background well AD-8 consistently has greater boron concentrations than downgradient well AD-23. Given that the uppermost aquifer unit is horizontally continuous in the area surrounding the Landfill (**Attachment B**), migration of boron from this upgradient location to downgradient wells is possible.

Sulfate and chloride concentration trends at AD-23 do not support a release from the Landfill. Sulfate and chloride are considered indicator parameters for potential CCR releases due to their concentrations in CCR source material and limited chemical attenuation along groundwater flow paths. A review of the sulfate and chloride concentrations at downgradient well AD-23 over time do not display an increasing trend, but rather generally stable concentrations which are less than or comparable to the downgradient monitoring wells (**Figures 4 and 5**).

AD-23 major ion geochemistry also does not support a release from the Landfill. Major ion chemistry for AD-23 over time is illustrated on a Piper diagram (**Figure 6**). The Piper diagram shows trends in major ion chemistry over time by indicating the relative proportion of individual major cations and anions. A Landfill release would be expected to cause notable changes in the major ion signature of AD-23 groundwater. AD-23 shows general geochemical stability over time, indicating that the geochemistry is not changing appreciably as would be expected in the event of a Landfill release.

A leachate sample collected in February 2023 from the Landfill had a reported sulfate concentration of 329 mg/L, which is over an order of magnitude higher than those observed at AD-23 (**Attachment C**). If Landfill leachate were impacting groundwater quality at downgradient wells, an increase in sulfate concentrations at AD-23 would also be expected. Therefore, the variability of boron in groundwater at AD-23 should not be attributed to a release from the Landfill.

TCEQ established a Texas-specific soil median background concentration of 30 milligrams per kilogram of boron in 30 TAC §350.51(m). Given the abundance of boron in Texas soils, some contribution of boron to groundwater from the aquifer is anticipated. Therefore, the boron concentrations observed at AD-23 are within the expected range attributable to natural variation within the aquifer. Groundwater boron concentrations at AD-23 are an order of magnitude lower than the Texas Risk Reduction Program (TRRP) Class I residential ingestion pathway limit ( $^{GW}GW_{Ing}$ ) of 4.9 mg/L (TCEQ 2009; updated TCEQ 2023a).

### 3.1.2 Chloride

The SSI for chloride was observed at monitoring well AD-36, which is located immediately downgradient of the Landfill adjacent to a non-CCR pond (**Figure 1**). Following the initial exceedance (14.8 mg/L, which exceeds the UPL of 11.8 mg/L) reported during the April 2024 sampling event, a verification event was completed. The June 2024 verification event chloride concentration at AD-36 (14.2 mg/L) confirmed the SSI.

Although chloride values have been slightly increasing at AD-36 since mid-2023, similar increases in chloride have also been observed at upgradient monitoring wells AD-16 and AD-27 (**Figure 5**). AD-36 aqueous chloride concentrations detected during the first semiannual and verification events were less than concentrations reported for upgradient well AD-16 (26.1 mg/L) (**Figure 5**).

Despite minor increases in chloride at AD-36, concentrations still fall within the range observed for background chloride from monitoring wells upgradient of the Landfill. Slight chloride increases within the background groundwater over multi-year time periods are occasionally observed and reflect natural fluctuations in aqueous chloride within the aquifer unit. These same fluctuations would be expected to occur within the AD-36 groundwater as well.

Boron and sulfate concentration trends at AD-36 do not support a release from the Landfill. A review of the boron and sulfate concentrations at downgradient well AD-36 over time do not display an increasing trend, but rather generally stable concentrations which are less than or comparable to the downgradient monitoring wells (**Figures 4 and 5**). A leachate sample collected in February 2023 from the Landfill leachate collection system had a reported sulfate concentration of 329 mg/L (**Attachment C**), which is almost two orders of magnitude higher than the groundwater concentrations observed at AD-36. If Landfill leachate were impacting groundwater quality at downgradient wells and causing the minor increases in chloride at AD-36, an increase in boron and sulfate concentrations at AD-36 would also be expected.

Based on the above evaluation, the variability of chloride in groundwater at AD-36 should not be attributed to the Landfill.

#### 3.1.2.1 *Effect of Construction Activities*

While the chloride concentrations found at AD-36 are indicative of a Type IV source, additional anthropogenic activities may be contributing factors. As discussed in previous ASDs (Geosyntec 2023; Geosyntec 2024c), several construction activities were completed in the vicinity of AD-36 in late 2022 and early 2023, including extensive earthwork and construction to support the installation of an evaporation system associated with plant closure at the brine pond immediately adjacent to well AD-36. An area of the non-CCR pond immediately adjacent to AD-36 was bermed and lined to support its use as brine storage, as shown in the photograph provided in **Figure 7**. The location of AD-36 relative to the recently constructed brine storage area is shown in **Figure 8**.

Well AD-36 is screened from 5-15 feet below ground surface, as shown in the boring log and well construction diagram provided as **Attachment D**. Given the proximity of the screen of well AD-36 to the ground surface and the previous construction activities occurring immediately adjacent to AD-36 within the non-CCR pond, these construction activities potentially resulted in changes to the groundwater composition at AD-36 (e.g., impacts from meteoric or surface water infiltration, infiltration of water used as dust suppressant on the adjacent gravel road).

### **3.2 Sampling Requirements**

As the ASD presented above supports the position that the identified SSIs were not due to a release from the Pirkey Landfill, the unit will remain in the detection monitoring program. Groundwater at the unit will continue to be sampled for Appendix III parameters semiannually.

## **4. CONCLUSIONS AND RECOMMENDATIONS**

The preceding information serves as the ASD prepared in accordance with 30 TAC §352.941(c)(2) and supports the position that the SSIs for boron and chloride identified during detection monitoring in April 2024 were not due to a release from the Landfill. The identified SSIs were instead attributed to naturally occurring aqueous boron and chloride concentrations found within the aquifer. Therefore, no further action is warranted, and the Pirkey Landfill will remain in the detection monitoring program. Certification of this ASD by a qualified professional engineer is provided in **Attachment E**.

#### Notes

- Monitoring well coordinates and water level data (collected on April 22, 23 and 24, 2024) provided by AEP.
- Site features based on information available in coal combustion residual (CCR) Groundwater Monitoring Well Network Evaluation Update (Arcadis 2022) provided by AEP.
- Groundwater elevation units are feet above mean sea level (ft msl).
- AD-10, AD-19, AD-20, AD-21, AD-29, and W-3 were not gauged during the April 2024 event.
- AD-7R replaced AD-7, which was abandoned.
- AD-7R (357.60 ft msl) was not used for contouring due to an anomalous reading.
- Wells shaded in grey were not used for contouring.
- Well 35 was abandoned on November 13, 2018.
- Removal of CCR plus one foot of material for the WBAP was completed for on July 26, 2022.
- Removal of CCR plus one foot of material for the EBAP was completed on July 20, 2023, for the East Pond.
- Removal of CCR plus one foot of material was completed for the FGDSA on September 18, 2023.
- Map is updated to incorporate Landfill survey data collected on May 1, 2024.
- Aerial imagery provided by ESRI, dated September 19, 2023.

### Report Verification

This report and the above data have been confirmed by the following analyst.

Michael Ohlinger, Chemist

Email: msohlinger@aep.com

Phone: 614-836-4184

Audinet: 8-210-4184

THIS TEST REPORT RELATES ONLY TO THE ITEMS TESTED AND SHALL NOT BE REPRODUCED EXCEPT IN FULL WITHOUT WRITTEN APPROVAL OF THE LABORATORY. ALL TEST RESULTS MEET ALL OF THE REQUIREMENTS OF THE ACCREDITING AUTHORITY, UNLESS OTHERWISE NOTED. ALL TIMES LISTED ARE IN THE EASTERN TIME ZONE.

### Data Qualifier Legend

U1 - Not detected at or below method detection limit (MDL).

J1 - Concentration estimated. Analyte was detected between the method detection limit and the reporting limit.

### Radiochemistry

Parameter	Result	Units	UNC*(+/-)	MDA*	Data Qualifiers	Analyst	Analysis Date	Method
Radium-226	0.55	pCi/L		0.13	0.16	ST	05/21/2024 09:02	SW-846 9315-1986, Rev. 0
Carrier Recovery	91.9	%						
Radium-228	1.63	pCi/L		0.17	0.50	TTP	05/24/2024 13:03	SW-846 9320-2014, Rev. 1.0
Carrier Recovery	83.4	%						

\* The Required Detection Limit (RDL) is equivalent to the RL and for Radium-226 and Radium-228, the RDL is calculated to be 1.0 pCi/L. The Minimal Detectable Activity (MDA) listed with these results is sample specific and empirical. The combined standard uncertainty (UNC) is a counting uncertainty representing "one-sigma" which has the same units of measurement as the result.

Carrier Recovery	100	%						
Radium-228	1.15	pCi/L		0.15	0.46	TTP	05/24/2024 13:03	SW-846 9320-2014, Rev. 1.0
Carrier Recovery	87.3	%						

\* The Required Detection Limit (RDL) is equivalent to the RL and for Radium-226 and Radium-228, the RDL is calculated to be 1.0 pCi/L. The Minimal Detectable Activity (MDA) listed with these results is sample specific and empirical. The combined standard uncertainty (UNC) is a counting uncertainty representing "one-sigma" which has the same units of measurement as the result.

### Radiochemistry

Parameter	Result	Units	UNC*(+/-)	MDA*	Data Qualifiers	Analyst	Analysis Date	Method
Radium-226	0.42	pCi/L		0.11	0.18	ST	05/21/2024 09:02	SW-846 9315-1986, Rev. 0
Carrier Recovery	104	%						
Radium-228	0.57	pCi/L		0.13	0.42	TTP	05/24/2024 13:02	SW-846 9320-2014, Rev. 1.0
Carrier Recovery	85.9	%						

\* The Required Detection Limit (RDL) is equivalent to the RL and for Radium-226 and Radium-228, the RDL is calculated to be 1.0 pCi/L. The Minimal Detectable Activity (MDA) listed with these results is sample specific and empirical. The combined standard uncertainty (UNC) is a counting uncertainty representing "one-sigma" which has the same units of measurement as the result.

### Radiochemistry

Parameter	Result	Units	UNC*(+/-)	MDA*	Data Qualifiers	Analyst	Analysis Date	Method
Radium-226	0.56	pCi/L		0.13	0.22	ST	05/21/2024 09:02	SW-846 9315-1986, Rev. 0
Carrier Recovery	98.4	%						
Radium-228	0.99	pCi/L		0.19	0.60 02, P2	TTP	06/05/2024 13:38	SW-846 9320-2014, Rev. 1.0
Carrier Recovery	75.8	%						

\* The Required Detection Limit (RDL) is equivalent to the RL and for Radium-226 and Radium-228, the RDL is calculated to be 1.0 pCi/L. The Minimal Detectable Activity (MDA) listed with these results is sample specific and empirical. The combined standard uncertainty (UNC) is a counting uncertainty representing "one-sigma" which has the same units of measurement as the result.

### Radiochemistry

Parameter	Result	Units	UNC*(+/-)	MDA*	Data Qualifiers	Analyst	Analysis Date	Method
Radium-226	0.48	pCi/L		0.12	0.21	ST	05/21/2024 11:31	SW-846 9315-1986, Rev. 0
Carrier Recovery	92.3	%						
Radium-228	1.16	pCi/L		0.17	0.51 02, P2	TTP	06/05/2024 13:38	SW-846 9320-2014, Rev. 1.0
Carrier Recovery	83.0	%						

\* The Required Detection Limit (RDL) is equivalent to the RL and for Radium-226 and Radium-228, the RDL is calculated to be 1.0 pCi/L. The Minimal Detectable Activity (MDA) listed with these results is sample specific and empirical. The combined standard uncertainty (UNC) is a counting uncertainty representing "one-sigma" which has the same units of measurement as the result.

4001 Bixby Road  
Groveport, OH 43125  
Phone: 614-836-4221  
Audinet: 210-4221

Job ID: 241410

Customer: Pirkey Power Station

Date Reported: 06/11/2024

### Report Verification

This report and the above data have been confirmed by the following analyst.

Michael Ohlinger, Chemist

Email: msohlinger@aep.com

Phone: 614-836-4184

Audinet: 8-210-4184

THIS TEST REPORT RELATES ONLY TO THE ITEMS TESTED AND SHALL NOT BE REPRODUCED EXCEPT IN FULL WITHOUT WRITTEN APPROVAL OF THE LABORATORY. ALL TEST RESULTS MEET ALL OF THE REQUIREMENTS OF THE ACCREDITING AUTHORITY, UNLESS OTHERWISE NOTED. ALL TIMES LISTED ARE IN THE EASTERN TIME ZONE.

### Data Qualifier Legend

U1 - Not detected at or below method detection limit (MDL).

J1 - Concentration estimated. Analyte was detected between the method detection limit and the reporting limit.

M1 - The associated matrix spike (MS) or matrix spike duplicate (MSD) recovery was outside acceptance limits.

O2 - Client did not provide additional bottles; therefore, the MS and duplicate are missing in this batch.

P2 - The precision on the laboratory control sample duplicate (LCSD) was above acceptance limits.

## SOIL/WELL BORING LOG

 <b>Auckland Consulting LLC</b> TBPE Firm No. F16721		 JOHN J. TAYNTOR 99202 04/30/2019	Well/Boring #: AD-36      Date Drilled: 4/24/19 Depth of Boring/well: 15 feet      Diameter of Boring: 8.25 inches Length of Screen: 10 feet      Diameter of Screen: 2 inches Length of Casing: 5 feet      Diameter of Casing: 2 inches Filter Pack: 20/40      Slot Size: 0.010 inches Logged By: John J. Tayntor      Screen Material: Sch 40 PVC			
			 - Concrete/cement      - Clay      - Silty Sand - Bentonite      - Silty Clay      - Sandy Clay - Well Screen      - Sand      - Lignite  - Gravel      ▽ - Initial Water Level			
Depth Feet	GEOLOGIC DESCRIPTION	Lithology Classification	PID ppm	Depth Feet	Well Completion and Lithology	Remarks
0.0	Fill - Reddish Brown, Sandy Lean Clay (CL) with gravel	CL/Fill	0-9			
5.0	Reddish Brown and Tan, Clayey Sand (SC), with gravel	SC	9-11			
10.0	Reddish brown, Sandy Lean Clay (CL), few gravel	CL	11-14			
15.0	Reddish brown, Clayey Sand (SC), with gravel	SC	14-15			
	Well TD = 15 feet.					

\*Soil descriptions based on visual observations and intervals are approximate.  
 MW Location Coordinates: N6871017.4, E3202874.4
